PIXXI-28 (28-Pin 6x6 QFN)
PIXXI-44 (44-Pin 8x8 QFN)

Embedded Graphics Processors

INTERNAL FUNCTIONS

Document Revision: 1.9
Document Date: 6th October 2022

Table of Contents

1. 4DGL Introduction.....	13
2. PIXXI Chip-Resident Functions	14
2.1. Ctype Functions	21
2.1.1 isdigit(char)	22
2.1.2 isxdigit(char).....	23
2.1.3 isupper(char).....	24
2.1.4 islower(char)	25
2.1.5 isalpha(char).....	26
2.1.6 isalnum(char)	27
2.1.7 isprint(char).....	28
2.1.8 isspace(char)	29
2.1.9 toupper(char).....	30
2.1.10 tolower(char)	31
2.1.11 LObyte(var)	32
2.1.12 HIbyte(var)	33
2.1.13 ByteSwap(var)	34
2.2. Display I/O Functions	35
2.2.1 disp_SetReg(register, data).....	36
2.2.2 disp_setGRAM(x1, y1, x2, y2)	37
2.2.3 disp_WrGRAM(colour).....	38
2.2.4 disp_WriteControl(value)	39
2.2.5 disp_WriteWord(value)	40
2.2.6 disp_ReadWord(command, dummy).....	41
2.2.7 disp_Sync(line)	42
2.2.8 disp_Disconnect()	43
2.2.9 disp_Init()	44
2.3. FAT16 File Functions.....	45
2.3.1 file_Error().....	46
2.3.2 file_Count(filename)	47
2.3.3 file_Dir(filename)	48
2.3.4 file_FindFirst(fname).....	49
2.3.5 file_FindNext()	50
2.3.6 file_Exists(fname).....	51
2.3.7 file_Open(fname, mode).....	52
2.3.8 file_Close(handle)	53

2.3.9 file_Read(destination, size, handle).....	54
2.3.10 file_Seek(handle, HiWord, LoWord)	55
2.3.11 file_Index(handle, Hisize, LoSize, recordnum).....	56
2.3.12 file_Tell(handle, &HiWord, &LoWord)	57
2.3.13 file_Write(*source, size, handle).....	58
2.3.14 file_Size(handle, &HiWord, &LoWord).....	59
2.3.15 file_Image(x, y, handle).....	60
2.3.16 file_ScreenCapture(x, y, width, height, handle)	61
2.3.17 file_PutC(char, handle)	62
2.3.18 file_GetC(handle)	63
2.3.19 file_PutW(word, handle).....	64
2.3.20 file_GetW(handle)	65
2.3.21 file_PutS(*source, handle)	66
2.3.22 file_GetS(*string, size, handle)	67
2.3.23 file_Erase(fname).....	68
2.3.24 file_Rewind(handle).....	69
2.3.25 file_LoadFunction(fname.4XE).....	70
2.3.26 file_Run(fname.4XE, arglistptr).....	72
2.3.27 file_Exec(fname.4XE, arglistptr).....	77
2.3.28 file_LoadImageControl(fname1, fname2, mode)	79
2.3.29 file_Mount().....	82
2.3.30 file_MountSpeed(speed)	83
2.3.31 file_Unmount().....	84
2.3.32 file_PlayWAV(fname).....	85
2.3.33 file_CheckUpdate(filename, options)	86
2.4. Flash Memory Functions	87
2.4.1 flash_SIG()	88
2.4.2 flash_ID()	89
2.4.3 flash_BulkErase().....	90
2.4.4 flash_Block32Erase()	91
2.4.5 flash_Block64Erase()	92
2.4.6 flash_Sector4Erase()	93
2.5. Internal Flash Functions	94
2.5.1 intflash_GetByte(ptr)	95
2.5.2 intflash_GetWord(ptr)	96
2.5.3 intflash_Copy(ptr, dest, count)	97
2.5.4 intflash_WriteBlock(sourceptr, size).....	98

2.5.5 intflash_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap)	99
2.5.6 intflash_FunctionFreeCache(handle).....	100
2.6. General Purpose Functions	101
2.6.1 pause(time)	102
2.6.2 lookup8(key, byteConstList)	103
2.6.3 lookup16(key, wordConstList)	104
2.6.4 rect_Intersect(&rect1, &rect2)	105
2.6.5 rect_Within(&rect1, &rect2).....	106
2.7. GPIO Functions	107
2.7.1 pin_Set(mode, pin)	108
2.7.2 pin_HI(pin)	110
2.7.3 pin_LO(pin)	111
2.7.4 pin_Read(pin).....	112
2.7.5 OW_Reset(pin).....	113
2.7.6 OW_Read(pin).....	114
2.7.7 OW_Read9(pin).....	115
2.7.8 OW_Write(pin, value).....	116
2.7.9 joystick(pin).....	118
2.7.10 bus_In()	119
2.7.11 bus_Out(value)	120
2.8. Graphics Functions	121
2.8.1 gfx_Cls().....	123
2.8.2 gfx_ChangeColour(oldColour, newColour)	124
2.8.3 gfx_Circle(x, y, radius, colour).....	125
2.8.4 gfx_CircleFilled(x, y, radius, colour)	126
2.8.5 gfx_Line(x1, y1, x2, y2, colour).....	127
2.8.6 gfx_Hline(y, x1, x2, colour).....	128
2.8.7 gfx_Vline(x, y1, y2, colour).....	129
2.8.8 gfx_Rectangle(x1, y1, x2, y2, colour)	130
2.8.9 gfx_RectangleFilled(x1, y1, x2, y2, colour).....	131
2.8.10 gfx_RoundRect(x1, y1, x2, y2, rad, colour)	132
2.8.11 gfx_Polyline(n, vx, vy, colour)	133
2.8.12 gfx_Polygon(n, vx, vy, colour)	135
2.8.13 gfx_Triangle(x1, y1, x2, y2, x3, y3, colour).....	136
2.8.14 gfx_Dot()	137
2.8.15 gfx_Bullet(radius).....	138

2.8.16 gfx_OrbitInit(&x_dest, &y_dest).....	139
2.8.17 gfx_Orbit(angle, distance).....	140
2.8.18 gfx_PutPixel(x, y, colour)	141
2.8.19 gfx_GetPixel(x, y)	142
2.8.20 gfx_MoveTo(xpos, ypos).....	143
2.8.21 gfx_MoveRel(xoffset, yoffset).....	144
2.8.22 gfx_IncX()	145
2.8.23 gfx_IncY()	146
2.8.24 gfx_LineTo(xpos, ypos).....	147
2.8.25 gfx_LineRel(xpos, ypos).....	148
2.8.26 gfx_BoxTo(x2, y2).....	149
2.8.27 gfx_Ellipse(x, y, xrad, yrad, colour)	150
2.8.28 gfx_EllipseFilled(x, y, xrad, yrad, colour)	151
2.8.29 gfx_ScreenCopyPaste(xs, ys, xd, yd, width, height).....	152
2.8.30 gfx_RGBto565(RED, GREEN, BLUE)	153
2.8.31 gfx_332to565(COLOUR).....	154
2.8.32 gfx_TriangleFilled(x1, y1, x2, y2, x3, y3, colour)	155
2.8.33 gfx_PolygonFilled(n, vx, vy, colour)	156
2.8.34 gfx_Origin(x, y)	157
2.8.35 gfx_SetClipRegion().....	158
2.8.36 gfx_ClipWindow(x1, y1, x2, y2).....	159
2.8.37 gfx_Get(mode)	160
2.8.38 gfx_Set(function, value)	161
2.8.39 gfx_RingSegment(x, y, Rad1, Rad2, starta, enda, colour).....	163
2.8.40 gfx_ReadGRAMarea(x1, y1, x2, y2, ptr)	164
2.8.41 gfx_WriteGRAMarea(x1, y1, x2, y2, ptr)	165
2.8.42 gfx_Surround(x1, y1, x2, y2, rad1, rad2, colour)	166
2.8.43 gfx_Gradient(style, x1, y1, x2, y2, color1, color2)	167
2.8.44 gfx_RoundGradient(style, x1, y1, x2, y2, radius, color1, color2)	168
2.8.45 gfx_XYrotToVal(x, y, base, mina, maxa, minv, maxv)	169
2.8.46 gfx_XYlinToVal(x, y, base, minpos, maxpos, minv, maxv).....	170
2.8.47 gfx_SpriteSet(bitmap, colours, palette)	171
2.8.48 gfx_BlitSprite(spritenumber, palette, xpos, ypos, orientation, preimage).....	172
2.8.49 gfx_Button(state, x, y, buttonColour, txtColour, font, txtWidth txtHeight, text).....	173
2.8.50 gfx_Button4(state, &gfx_ButtonRam, &gfx_ButtonDef).....	175
2.8.51 gfx_Switch(state, &SwitchRam, &SwitchDef).....	177
2.8.52 gfx_Slider(mode, x1, y1, x2, y2, colour, scale, value)	178

2.8.53 gfx_Slider5(value, &SliderRam, &SliderDef)	179
2.8.54 gfx_Dial(value, &DialRam, &DialDef)	181
2.8.55 gfx_AngularMeter(value, &MeterRam, &MeterDef)	183
2.8.56 gfx_Needle(value, &NeedleRam, &NeedleDef)	185
2.8.57 gfx_Gauge(value, &GaugeRam, &GaugeDef)	187
2.8.58 gfx_RulerGauge(value, &RulerGaugeRam, &RulerGaugeDef)	189
2.8.59 gfx_Led(state, &LedRam, &LedDef)	190
2.8.60 gfx_LedDigits(value, &LedDigitRam, &LedDigitDef)	191
2.8.61 gfx_LedDigit(x, y, digitsize, oncolour, offcolour, value)	193
2.8.62 gfx_Scale(&ScaleRam, &ScaleDef)	194
2.8.63 gfx_Panel(state, x, y, Width, Height, Colour)	196
2.8.64 gfx_Panel2(state, x, y, width, height, w1, w2, cl, cr)	197
2.8.65 gfx_GradientShape(GradientRAM, HorzVert, OuterWidth, X, Y, W, H, TLrad, TRrad, BLrad, BRrad, Darken, OuterColor, OuterType, OuterLevel, InnerColor, InnerType, InnerLevel, Split)	198
2.8.66 gfx_GradientColor (Type, Darken, Level, H, Pos, Color)	200
2.8.67 gfx_GradTriangleFilled(X0, Y0, X1, Y1, X2, Y2, SolidCol, GradientCol, GradientHeight, GradientY, GradientLevel, Type)	201
2.9. I2C BUS Master Functions	202
2.9.1 I2C1_Open(Speed) or I2C2_Open(Speed) or I2C3_Open(Speed)	203
2.9.2 I2C1_Close() or I2C2_Close() or I2C3_Close()	204
2.9.3 I2C1_Start() or I2C2_Start() or I2C3_Start()	205
2.9.4 I2C1_Stop() or I2C2_Stop() or I2C3_Stop()	206
2.9.5 I2C1_Restart() or I2C2_Restart() or I2C3_Restart()	207
2.9.6 I2C1_Read() or I2C2_Read() or I2C3_Read()	208
2.9.7 I2C1_Write(byte) or I2C2_Write(byte) or I2C3_Write(byte)	209
2.9.8 I2C1_Ack() or I2C2_Ack() or I2C3_Ack()	210
2.9.9 I2C1_Nack() or I2C2_Nack() or I2C3_Nack()	211
2.9.10 I2C1_AckStatus() or I2C2_AckStatus() or I2C3_AckStatus()	212
2.9.11 I2C1_AckPoll(control) or I2C2_AckPoll(control) or I2C3_AckPoll(control)	213
2.9.12 I2C1_Idle() or I2C2_Idle() or I2C3_Idle()	214
2.9.13 I2C1_Gets(buffer, size) or I2C2_Gets(buffer, size) or I2C3_Gets(buffer, size)	215
2.9.14 I2C1_Getn(buffer, count) or I2C2_Getn(buffer, count) or I2C3_Getn(buffer, count)	216
2.9.15 I2C1_Puts(buffer) or I2C2_Puts(buffer) or I2C3_Puts(buffer)	217
2.9.16 I2C1_Putn(buffer, count) or I2C2_Putn(buffer, count) or I2C3_Putn(buffer, count)	218
2.10. Image Control Functions	219
2.10.1 img_SetPosition(handle, index, xpos, ypos)	220
2.10.2 img_Enable(handle, index)	221

2.10.3 img_Disable(handle, index)	222
2.10.4 img_Darken(handle, index).....	223
2.10.5 img_Lighten(handle, index)	224
2.10.6 img_SetWord(handle, index, offset, word)	225
2.10.7 img_GetWord(handle, index, offset)	226
2.10.8 img_Show(handle, index)	227
2.10.9 img_SetAttributes(handle, index, value)	228
2.10.10 img_ClearAttributes(handle, index, value).....	229
2.10.11 img_Touched(handle, index)	230
2.10.12 img_FileRead(*dest, size, handle, index).....	231
2.10.13 img_FileSeek(handle, index, HiWord, LoWord).....	232
2.10.14 img_FileIndex(handle, index, HiSize, LoSize, recordnum)	233
2.10.15 img_FileTell(handle, index, &HiWord, &LoWord)	234
2.10.16 img_FileSize(handle, index, &HiWord, &LoWord).....	235
2.10.17 img_FileGetC(handle, index).....	236
2.10.18 img_FileGetW(handle, index)	237
2.10.19 img_FileGetS(*string, size, handle, index).....	238
2.10.20 img_FileRewind(handle, index)	239
2.10.21 img_FileLoadFunction(handle, index).....	240
2.10.22 img_FileRun(handle, index, arglistptr).....	241
2.10.23 img_FileExec(handle, index, arglistptr).....	242
2.10.24 img_FilePlayWAV(handle, index).....	243
2.10.25 img_TxtFontID(handle, index)	244
2.10.26 img_FileCheckUpdate(handle, index, options).....	245
2.10.27 img_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap).....	246
2.10.28 img_FunctionFreeCache(handle).....	248
2.11. Maths Functions	249
2.11.1 ABS(value)	250
2.11.2 MIN(value1, value2).....	251
2.11.3 MAX(value1, value2)	252
2.11.4 SWAP(&var1, &var2).....	253
2.11.5 SIN(angle).....	254
2.11.6 COS(angle).....	255
2.11.7 RAND()	256
2.11.8 SEED(number)	257
2.11.9 SQRT(number).....	258

2.11.10 OVF()	259
2.11.11 CY()	260
2.11.12 umul_1616(&res32, val1, val2)	261
2.11.13 uadd_3232(&res32, &val1, &val2)	262
2.11.14 usub_3232(&res32, &val1, &val2)	263
2.11.15 ucmp_3232(&val1, &val2)	264
2.11.16 udiv_3232(&res32, val1, val2)	265
2.12. Media Functions (SD/SDHC Memory Card or Serial Flash chip)	266
2.12.1 media_Init()	267
2.12.2 media_Init4()	268
2.12.3 media_InitSpeed(speed)	269
2.12.4 media_SetAdd(Hlword, LWord)	270
2.12.5 media_SetSector(Hlword, LWord)	271
2.12.6 media_RdSector(Destination_Address)	272
2.12.7 media_WrSector(Source_Address)	273
2.12.8 media_ReadByte()	274
2.12.9 media_ReadWord()	275
2.12.10 media_WriteByte(byte_val)	276
2.12.11 media_WriteWord(word_val)	277
2.12.12 media_Flush()	278
2.12.13 media_Image(x, y)	279
2.12.14 media_Video(x, y)	280
2.12.15 media_VideoFrame(x, y, frameNumber)	281
2.13. Memory Allocation Functions	283
2.13.1 mem_Alloc(size)	284
2.13.2 mem_AllocV(size)	285
2.13.3 mem_AllocZ(size)	286
2.13.4 mem_Realloc(ptr, size)	287
2.13.5 mem_Free(allocation)	288
2.13.6 mem_Heap()	289
2.13.7 mem_Set(ptr, char, size)	290
2.13.8 mem_Copy(source, destination, count)	291
2.13.9 mem_Compare(ptr1, ptr2, count)	292
2.14. Misc System Functions	293
2.14.1 sys_PmmC()	294
2.14.2 sys_Driver()	295
2.15. Serial (UART) Communications Functions	296

2.15.1 setbaud(rate)	297
2.15.2 com_SetBaud(comport, baudrate/10)	298
2.15.3 com_Mode(Databits, parity, Stopbits, comport).....	299
2.15.4 serin()	300
2.15.5 serout(char)	301
2.15.6 com_Init(buffer, bufsize, qualifier)	302
2.15.7 com_Reset()	303
2.15.8 com_Count()	304
2.15.9 com_Full()	305
2.15.10 com_Error().....	306
2.15.11 com_Sync().....	307
2.15.12 com_TXbuffer(buf, bufsize,pin)	308
2.15.13 com_TXbufferHold(state)	309
2.15.14 com_TXcount().....	310
2.15.15 com_TXemptyEvent(function)	311
2.15.16 com_InitBrk(buffer, bufsize, qualifier) or com1_InitBrk (buffer, bufsize, qualifier).....	313
2.15.17 com_TXbufferBrk(buf, bufsize,pin) or com1_TXbufferBrk(buf, bufsize,pin)	314
2.16. Sound Control Functions	315
2.16.1 snd_Volume(var).....	316
2.16.2 snd_Pitch(pitch)	317
2.16.3 snd_BufSize(var)	318
2.16.4 snd_Stop()	319
2.16.5 snd_Pause().....	320
2.16.6 snd_Continue().....	321
2.16.7 snd_Playing().....	322
2.16.8 snd_Freq(freq, duration)	323
2.16.9 snd_RTTTL(tunePtr)	324
2.17. SPI Control Functions	327
2.17.1 spi_Init(speed, input_mode, output_mode)	328
2.17.2 spi_Read()	330
2.17.3 spi_Write(byte)	331
2.17.4 spi_Disable().....	332
2.18. String Class Functions.....	333
2.18.1 str_Ptr(&var)	334
2.18.2 str_GetD(&ptr, &var)	335
2.18.3 str_GetW(&ptr, &var)	336
2.18.4 str_GetHexW(&ptr, &var).....	337

2.18.5 str_GetC(&ptr, &var)	338
2.18.6 str_GetByte(ptr).....	339
2.18.7 str_GetWord(ptr).....	340
2.18.8 str_PutByte(ptr, val).....	341
2.18.9 str_PutWord(ptr, val).....	342

1. 4DGL Introduction

The 4D Labs family of embedded graphics processors (Goldelox, Picasso, Diablo16, PIXXI-28, and PIXXI-44) are powered by a highly optimised soft-core virtual engine, E.V.E. (Extensible Virtual Engine). EVE was designed and created by 4D Labs in the early 2000's, and should not be confused by FTDI's solution of EVE, which was developed a decent decade or so later.

EVE is a proprietary, high performance virtual processor with an extensive byte-code instruction set optimised to execute compiled 4DGL programs. 4DGL (4D Graphics Language) was specifically developed from ground up for the EVE engine core. It is a high-level language which is easy to learn and simple to understand yet powerful enough to tackle many embedded graphics applications.

4DGL is a graphics-oriented language allowing rapid application development. An extensive library of graphics, text and file system functions and the ease of use of a language that combines the best elements and syntax structure of languages such as C, Basic, Pascal, etc. Programmers familiar with these languages will feel right at home with 4DGL. It includes many familiar instructions such as IF..ELSE..ENDIF, WHILE..WEND, REPEAT..UNTIL, GOSUB..ENDSUB, GOTO as well as a wealth of (chip-resident) internal functions that include SERIN, SEROUT, GFX_LINE, GFX_CIRCLE and many more.

This document covers the internal (chip-resident) functions available for the PIXXI-28 and PIXXI-44 processors. This document should be used in conjunction with "**4DGL-Programmers-Reference-Manual**" document.

2. PIXXI Chip-Resident Functions

The following is a summary of chip-resident 4DGL functions within the PIXXI-28 and PIXXI-44 graphics processors.

Ctype Functions

- isdigit(char)
- isxdigit(char)
- isupper(char)
- islower(char)
- isalpha(char)
- isalnum(char)
- isprint(char)
- isspace(char)
- toupper(char)
- tolower(char)
- LByte(var)
- HByte(var)
- ByteSwap(var)

Display I/O Functions

- disp_SetReg(register, data)
- disp_setGRAM(x1, y1, x2, y2)
- disp_WrGRAM(colour)
- disp_WriteControl(value)
- disp_WriteWord(value)
- disp_ReadWord(command, dummy)
- disp_Sync(line)
- disp_Disconnect()
- disp_Init()

FAT16 File Functions

- file_Error()
- file_Count(filename)
- file_Dir(filename)
- file_FindFirst(fname)
- file_FindNext()
- file_Exists(fname)
- file_Open(fname, mode)
- file_Close(handle)
- file_Read(destination, size, handle)
- file_Seek(handle, HiWord, LoWord)
- file_Index(handle, Hisize, LoSize, recordnum)
- file_Tell(handle, &HiWord, &LoWord)
- file_Write(*source, size, handle)
- file_Size(handle, &HiWord, &LoWord)
- file_Image(x, y, handle)
- file_ScreenCapture(x, y, width, height, handle)
- file_PutC(char, handle)
- file_GetC(handle)
- file_PutW(word, handle)
- file_GetW(handle)
- file_PutS(*source, handle)
- file_GetS(*string, size, handle)

- file_Erase(fname)
- file_Rewind(handle)
- file_LoadFunction(fname.4XE)
- file_Run(fname.4XE, arglistptr)
- file_Exec(fname.4XE, arglistptr)
- file_LoadImageControl(fname1, fname2, mode)
- file_Mount()
- file_MountSpeed(speed)
- file_Unmount()
- file_PlayWAV(fname)
- file_CheckUpdate(filename, options)

General Purpose Functions

- pause(time)
- lookup8(key, byteConstList)
- lookup16(key, wordConstList)
- rect_Intersect(&rect1, &rect2)
- rect_Within(&rect1, &rect2)

GPIO Functions

- pin_Set(mode, pin)
- pin_HI(pin)
- pin_LO(pin)
- pin_Read(pin)
- OW_Reset(pin)
- OW_Read(pin)
- OW_Read9(pin)
- OW_Write(pin, value)
- joystick(pin)

Graphics Functions

- gfx_Cls()
- gfx_ChangeColour(oldColour, newColour)
- gfx_Circle(x, y, radius, colour)
- gfx_CircleFilled(x, y, radius, colour)
- gfx_Line(x1, y1, x2, y2, colour)
- gfx_Hline(y, x1, x2, colour)
- gfx_Vline(x, y1, y2, colour)
- gfx_Rectangle(x1, y1, x2, y2, colour)
- gfx_RectangleFilled(x1, y1, x2, y2, colour)
- gfx_RoundRect(x1, y1, x2, y2, rad, colour)
- gfx_Polyline(n, vx, vy, colour)
- gfx_Polygon(n, vx, vy, colour)
- gfx_Triangle(x1, y1, x2, y2, x3, y3, colour)
- gfx_Dot()
- gfx_Bullet(radius)
- gfx_OrbitInit(&x_dest, &y_dest)
- gfx_Orbit(angle, distance)
- gfx_PutPixel(x, y, colour)
- gfx_GetPixel(x, y)
- gfx_MoveTo(xpos, ypos)
- gfx_MoveRel(xoffset, yoffset)
- gfx_IncX()
- gfx_IncY()

- gfx_LineTo(xpos, ypos)
- gfx_LineRel(xpos, ypos)
- gfx_BoxTo(x2, y2)
- gfx_Ellipse(x, y, xrad, yrad, colour)
- gfx_EllipseFilled(x, y, xrad, yrad, colour)
- gfx_ScreenCopyPaste(xs, ys, xd, yd, width, height)
- gfx_RGBto565(RED, GREEN, BLUE)
- gfx_332to565(COLOUR)
- gfx_TriangleFilled(x1, y1, x2, y2, x3, y3, colour)
- gfx_PolygonFilled(n, vx, vy, colour)
- gfx_Origin(x, y)
- gfx_SetClipRegion()
- gfx_ClipWindow(x1, y1, x2, y2)
- gfx_Get(mode)
- gfx_Set(function, value)
- gfx_RingSegment(x, y, Rad1, Rad2, starta, enda, colour)
- gfx_ReadGRAMarea(x1, y1, x2, y2, ptr)
- gfx_WriteGRAMarea(x1, y1, x2, y2, ptr)
- gfx_Surround(x1, y1, x2, y2, rad1, rad2, colour)
- gfx_Gradient(style, x1, y1, x2, y2, color1, color2)
- gfx_RoundGradient(style, x1, y1, x2, y2, radius, color1, color2)
- gfx_XYrotToVal(x, y, base, mina, maxa, minv, maxv)
- gfx_XYlinToVal(x, y, base, minpos, maxpos, minv, maxv)
- gfx_SpriteSet(bitmap, colours, palette)
- gfx_BlitSprite(spritenumber, palette, xpos, ypos, orientation, preimage)
- gfx_Button(state, x, y, buttonColour, txtColour, font, txtWidth, txtHeight, text)
- gfx_Button4(state, &gfx_ButtonRam, &gfx_ButtonDef)
- gfx_Switch(state, &SwitchRam, &SwitchDef)
- gfx_Slider(mode, x1, y1, x2, y2, colour, scale, value)
- gfx_Slider5(value, &SliderRam, &SliderDef)
- gfx_Dial(value, &DialRam, &DialDef)
- gfx_AngularMeter(value, &MeterRam, &MeterDef)
- gfx_Needle(value, &NeedleRam, &NeedleDef)
- gfx_Gauge(value, &GaugeRam, &GaugeDef)
- gfx_RulerGauge(value, &RulerGaugeRam, &RulerGaugeDef)
- gfx_Led(state, &LedRam, &LedDef)
- gfx_LedDigits(value, &LedDigitRam, &LedDigitDef)
- gfx_LedDigit(x, y, digitsize, oncolour, offcolour, value)
- gfx_Scale(&ScaleRam, &ScaleDef)
- gfx_Panel(state, x, y, Width, Height, Colour)
- gfx_Panel2(state, x, y, width, height, w1, w2, cl, cr)

I2C BUS Master Functions

- I2C1_Open(Speed) or I2C2_Open(Speed) or I2C3_Open(Speed)
- I2C1_Close() or I2C2_Close() or I2C3_Close()
- I2C1_Start() or I2C2_Start() or I2C3_Start()
- I2C1_Stop() or I2C2_Stop() or I2C3_Stop
- I2C1_Restart() or I2C2_Restart() or I2C3_Restart()
- I2C1_Read() or I2C2_Read() or I2C3_Read() I2C1_Stop() or I2C2_Stop() or I2C3_Stop()
- I2C1_Write(byte) or I2C2_Write(byte) or I2C3_Write(byte)
- I2C1_Ack() or I2C2_Ack() or I2C3_Ack()
- I2C1_Nack() or I2C2_Nack() or I2C3_Nack()
- I2C1_AckStatus() or I2C2_AckStatus() or I2C3_AckStatus()
- I2C1_AckPoll(control) or I2C2_AckPoll(control) or I2C3_AckPoll(control)

- I2C1_Idle() or I2C2_Idle() or I2C3_Idle()
- I2C1_Gets(buffer, size) or I2C2_Gets(buffer, size) or I2C3_Gets(buffer, size)
- I2C1_Getn(buffer, count) or I2C2_Getn(buffer, count) or I2C3_Getn(buffer, count)
- I2C1_Puts(buffer) or I2C2_Puts(buffer) or I2C3_Puts(buffer)
- I2C1_Putn(buffer, count) or I2C2_Putn(buffer, count) or I2C3_Putn(buffer, count)

Image Control Functions

- img_SetPosition(handle, index, xpos, ypos)
- img_Enable(handle, index)
- img_Disable(handle, index)
- img_Darken(handle, index)
- img_Lighten(handle, index)
- img_SetWord(handle, index, offset, word)
- img_GetWord(handle, index, offset)
- img_Show(handle, index)
- img_SetAttributes(handle, index, value)
- img_ClearAttributes(handle, index, value)
- img_Touched(handle, index)
- img_FileRead(*dest, size, handle, index)
- img_FileSeek(handle, index, HiWord, LoWord)
- img_FileIndex(handle, index, HiSize, LoSize, recordnum)
- img_FileTell(handle, index, &HiWord, &LoWord)
- img_FileSize(handle, index, &HiWord, &LoWord)
- img_FileGetC(handle, index)
- img_FileGetW(handle, index)
- img_FileGetS(*string, size, handle, index)
- img_FileRewind(handle, index)
- img_FileLoadFunction(handle, index)
- img_FileRun(handle, index, arglistptr)
- img_FileExec(handle, index, arglistptr)
- img_FilePlayWAV(handle, index)
- img_TxtFontID(handle, index)
- img_FileCheckUpdate(handle, index, options)
- img_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap)
- img_FunctionFreeCache(handle)

Maths Functions

- ABS(value)
- MIN(value1, value2)
- MAX(value1, value2)
- SWAP(&var1, &var2)
- SIN(angle)
- COS(angle)
- RAND()
- SEED(number)
- SQRT(number)
- OVF()
- CY()
- umul_1616(&res32, val1, val2)
- uadd_3232(&res32, &val1, &val2)
- usub_3232(&res32, &val1, &val2)
- ucmp_3232(&val1, &val2)
- udiv_3232(&res32, val1, val2)

Media Functions (SD/SDHC Memory Card or Serial Flash chip)

- media_Init()
- media_InitSpeed(speed)
- media_SetAdd(Hlword, LOword)
- media_SetSector(Hlword, LOword)
- media_RdSector(Destination_Address)
- media_WrSector(Source_Address)
- media_ReadByte()
- media_ReadWord()
- media_WriteByte(byte_val)
- media_WriteWord(word_val)
- media_Flush()
- media_Image(x, y)
- media_Video(x, y)
- media_VideoFrame(x, y, frameNumber)

Memory Allocation Functions

- mem_Alloc(size)
- mem_AllocV(size)
- mem_AllocZ(size)
- mem_Realloc(ptr, size)
- mem_Free(allocation)
- mem_Heap()
- mem_Set(ptr, char, size)
- mem_Copy(source, destination, count)
- mem_Compare(ptr1, ptr2, count)

Misc System Functions

- sys_PmmC()
- sys_Driver()

Serial (UART) Communications Functions

- setbaud(rate)
- com_SetBaud(comport, baudrate/10)
- com_Mode(Databits, parity, Stopbits, comport)
- serin()
- serout(char)
- com_Init(buffer, bufsize, qualifier)
- com_Reset()
- com_Count()
- com_Full()
- com_Error()
- com_Sync()
- com_TXbuffer(buf, bufsize,pin)
- com_TXbufferHold(state)
- com_TXcount()
- com_TXemptyEvent(function)

Sound Control Functions

- snd_Volume(var)
- snd_Pitch(pitch)
- snd_BufSize(var)
- snd_Stop()
- snd_Pause()

- `snd_Continue()`
- `snd_Playing()`
- `snd_Freq(freq, duration)`
- `snd_RTTTL(tunePtr)`

SPI Control Functions

- `spi_Init(speed, input_mode, output_mode)`
- `spi_Read()`
- `spi_Write(byte)`
- `spi_Disable()`

String Class Functions

- `str_Ptr(&var)`
- `str_GetD(&ptr, &var)`
- `str_GetW(&ptr, &var)`
- `str_GetHexW(&ptr, &var)`
- `str_GetC(&ptr, &var)`
- `str_GetByte(ptr)`
- `str_GetWord(ptr)`
- `str_PutByte(ptr, val)`
- `str_PutWord(ptr, val)`
- `str_Match(&ptr, *str)`
- `str_Matchl(&ptr, *str)`
- `str_Find(&ptr, *str)`
- `str_Findl(&ptr, *str)`
- `str_Length(ptr)`
- `str_Printf(&ptr, *format)`
- `str_Cat(&destination, &source)`
- `str_CatN(&ptr, str, count)`
- `str_BytMove(src, dest, count)`
- `str_Copy(dest, src)`
- `str_CopyN(dest, src, count)`

System Memory Access Functions

- `peekW(address)`
- `pokeW(address, word_value)`

Text and String Functions

- `txt_MoveCursor(line, column)`
- `putch(char)`
- `putstr(pointer)`
- `putstrCentred(xc, yc, string)`
- `putnum(format, value)`
- `print(...)`
- `to(outstream)`
- `charwidth('char')`
- `charheight('char')`
- `strwidth(pointer)`
- `strheight()`
- `strlen(pointer)`
- `txt_Set(function, value)`

Timer Functions

- sys_T()
- sys_T_HI()
- sys_SetTimer(timernum, value)
- sys_GetTimer(timernum)
- sys_SetTimerEvent(timernum, function)
- sys_EventQueue()
- sys_EventsPostpone()
- sys_EventsResume()
- sys_DeepSleep(units)
- sys_Sleep(units)
- iterator(offset)

Touch Screen Functions

- touch_DetectRegion(x1, y1, x2, y2)
- touch_Set(mode)
- touch_Get(mode)

Widget Functions

- widget_Create(count)
- widget_Add(hndl, index, widget)
- widget_Delete(hndl, index)
- widget_Realloc(handle, n)
- widget_LoadFlash(Extra)
- widget_Show(hndl, index)
- widget_SetWord(hndl, index, offset, value)
- widget_GetWord(hndl, index, offset)
- widget_Setposition(hndl, index, xpos, ypos)
- widget_Enable(hndl, index)
- widget_Disable(hndl, index)
- widget_SetAttributes(hndl, index, value)
- widget_ClearAttributes(hndl, index, value)
- widget_Touched(hndl, index)
- widget_FontID(id)

2.1. Ctype Functions

Summary of functions in this section:

- `isdigit(char)`
- `isxdigit(char)`
- `isupper(char)`
- `islower(char)`
- `isalpha(char)`
- `isalnum(char)`
- `isprint(char)`
- `isspace(char)`
- `toupper(char)`
- `tolower(char)`
- `LObyte(var)`
- `Hlbyte(var)`
- `ByteSwap(var)`

2.1.1 isdigit(char)

Syntax	isdigit(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not as ASCII digit 1: Character is an ASCII digit.
Description	Tests the character parameter and returns a 1 if the character is an ASCII digit else returns a 0. Valid range: "0123456789"	
Example	<pre>func main() var ch; gfx_Cls(); txt_Set(FONT_ID, FONT2); print ("Serial Input Test\n"); print ("Download prog to flash\n"); print ("Then use debug terminal\n"); to(COM0); print("serial input test:\n"); repeat ch := serin(); if (ch != -1) print([CHR] ch); // if a key was received from PC, // print its ascii value if(isdigit(ch)) print("Character is an ASCII digit\n"); if(isxdigit(ch)) print("Character is ASCII Hexadecimal\n"); if(isupper(ch)) print("Character is ASCII uppercase letter\n"); if(islower(ch)) print("Character is ASCII uppercase letter\n"); if(isalpha(ch)) print("Character is ASCII uppercase or lowercase\n"); if(isalnum(ch)) print("Character is an ASCII Alphanumeric\n"); if (isprint(ch)) print("Character is a printable ASCII\n"); if (isspace(ch)) print("Character is a space type character\n"); endif forever endfunc</pre>	

2.1.2 isxdigit(char)

Syntax	isxdigit(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not as ASCII hexadecimal digit 1: Character is an ASCII hexadecimal digit.
Description	Tests the character parameter and returns a 1 if the character is an ascii hexadecimal digit else returns a 0. Valid range: "0123456789ABCDEF"	
Example	Refer to isdigit() example.	

2.1.3 isupper(char)

Syntax	isupper(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not an ASCII upper case letter. 1: Character is an ASCII upper case letter.
Description	Tests the character parameter and returns a 1 if the character is an ASCII upper case letter else returns a 0. Valid range: "ABCDEF....WXYZ"	
Example	Refer to isdigit() example.	

2.1.4 islower(char)

Syntax	islower(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not an ASCII lower case letter 1: Character is an ASCII lower case letter.
Description	Tests the character parameter and returns a 1 if the character is an ASCII lower case letter else returns a 0. Valid range: "abcd....wxyz"	
Example	Refer to isdigit() example.	

2.1.5 isalpha(char)

Syntax	isalpha(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not an ASCII lower or upper case letter. 1: Character is an ASCII lower or upper case letter.
Description	Tests the character parameter and returns a 1 if the character is an ASCII lower or upper case letter else returns a 0. Valid range: "abcd....wxyz", "ABCD....WXYZ"	
Example	Refer to isdigit() example.	

2.1.6 isalnum(char)

Syntax	<code>isalnum(char);</code>	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not as ASCII Alphanumeric character. 1: Character is an ASCII Alphanumeric character.
Description	Tests the character parameter and returns a 1 if the character is an ASCII Alphanumeric else returns a 0. Valid range: "abcd....wxyz", "ABCD....WXYZ", "0123456789"	
Example	Refer to isdigit() example.	

2.1.7 isprint(char)

Syntax	isprint(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not a printable ASCII character. 1: Character is a printable ASCII character.
Description	Tests the character parameter and returns a 1 if the character is a printable ASCII character else returns a 0. Valid range: 0x20... 0x7F	
Example	Refer to isdigit() example.	

2.1.8 isspace(char)

Syntax	<code>isspace(char);</code>	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	0: Character is not a space type character. 1: Character is a space type character.
Description	Tests the character parameter and returns a 1 if the character is any one of the space type character else returns a 0. Valid range: space, formfeed, newline, carriage return, tab, vertical tab.	
Example	Refer to isdigit() example.	

2.1.9 toupper(char)

Syntax	toupper(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	char	
	char	"ABCD...WXYZ" : If character is a lower case letter. char : If character is not a lower case letter.
Description	Tests the character parameter and if the character is a lower case letter it returns the upper case equivalent else returns the passed char. Valid range: "abcd ... wxyz".	
Example	<pre> func main() var ch, Upconvch, Loconvch; gfx_Cls(); txt_Set(FONT_ID, FONT2); print ("Serial Input Test\n"); print ("Download prog to flash\n"); print ("Then use debug terminal\n"); to(COM0); print("serial input test:\n"); // now just stay in a loop repeat ch := serin(); if (ch != -1) print([CHR] ch); // if a key was received from PC, // print its ascii value if (isupper(ch)) print("Uppercase ASCII found. Converting to lowercase"); Loconvch := tolower(ch); endif if (islower(ch)) print("Lowercase ASCII found. Converting to Uppercase"); Upconvch := toupper(ch); endif endif forever endfunc </pre>	

2.1.10 tolower(char)

Syntax	tolower(char);	
Arguments	char	
	char	Specifies the ASCII character for the test
Returns	status	
	status	"abcd...wxyz" : If character is an upper case letter. char : If character is not an upper case letter...
Description	Tests the character parameter and if the character is an upper case letter it returns the lower case equivalent else returns the passed char. Valid range : "ABCD ... WXYZ".	
Example	Refer to toupper() example.	

2.1.11 LByte(var)

Syntax	LByte(var);	
Arguments	var	
	var	User variable
Returns	byte	
	byte	Returns the lower byte (lower 8 bit) of a 16-bit variable.
Description	Returns the lower byte (lower 8 bit) of a 16-bit variable.	
Example	<code>myvar := LByte (myvar2);</code>	

2.1.12 HIbyte(var)

Syntax	HIbyte(var);	
Arguments	var	
	var	User variable
Returns	byte	
	byte	Returns the upper byte (upper 8 bits) of a 16-bit variable.
Description	Returns the upper byte (upper 8 bits) of a 16-bit variable.	
Example	<code>myvar := HIbyte (myvar2);</code>	

2.1.13 ByteSwap(var)

Syntax	ByteSwap(var);	
Arguments	var	
	var	User variable
Returns	status	
	status	Returns the endian swapped value of a 16-bit variable.
Description	Returns the swapped upper and lower bytes of a 16-bit variable.	
Example	<code>myvar := ByteSwap (myvar2) ;</code>	

2.2. Display I/O Functions

These functions allow direct display access for fast blitting operations. Summary of functions in this section:

- disp_SetReg(register, data)
- disp_setGRAM(x1, y1, x2, y2)
- disp_WrGRAM(colour)
- disp_WriteControl(value)
- disp_WriteWord(value)
- disp_ReadWord(command, dummy)
- disp_Sync(line)
- disp_Disconnect()
- disp_Init()

2.2.1 disp_SetReg(register, data)

Syntax	disp_SetReg(register, data);	
Arguments	register, data	
	register	Refer to the display driver data sheet
	data	Refer to the display driver data sheet
Returns	nothing	
Description	Sets the Display driver IC register from display driver datasheet.	

2.2.2 disp_setGRAM(x1, y1, x2, y2)

Syntax	<code>disp_setGRAM(x1, y1, x2, y2);</code>	
Arguments	x1, y1, x2, y2	
	x1, y1	Top left of the GRAM window
	x2, y2	Bottom right of the GRAM window
Returns	the LO word of the 32 bit pixel count is returned	
Description	Prepares the (Graphics RAM) GRAM area for user access. The lower 16 bits of the pixel count in the selected area is returned. This is usually all that is needed unless GRAM area exceeds 256^2. A copy of the 32 bit value can be found in GRAM_PIXEL_COUNT_LO and GRAM_PIXEL_COUNT_HI.	
Example	<code>disp_setGRAM(40, 60, 100, 150);</code>	

2.2.3 disp_WrGRAM(colour)

Syntax	disp_WrGRAM(colour);	
Arguments	colour	
	colour	Pixel color to be populated
Returns	nothing	
Description	Data can be written to the GRAM consecutively using this function once the GRAM access window has been setup.	
Example	<code>disp_WrGRAM(0xFFFF0);</code>	

2.2.4 disp_WriteControl(value)

Syntax	<code>disp_WriteControl(value);</code>
Arguments	value
	value Specifies the 16 bit value to be written to the display control register The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Sends a 16 bit value to the display bus. Refer to individual data sheets for the display for more information. This function is used to extend the capabilities of the user code to gain access to the display hardware.
Example	<code>disp_WriteControl(0x0FFA);</code>

2.2.5 disp_WriteWord(value)

Syntax	disp_WriteWord(value);	
Arguments	value	
	value	Specifies the value to be written to the display data register
		The arguments can be a variable, array element, expression or constant
Returns	nothing	
Description	Sends a 16 bit value to the display bus. Refer to individual data sheets for the display for more information. This function is used to extend the capabilities of the user code to gain access to the display hardware.	
Example	<code>disp_WriteWord(0x7FF0);</code>	

2.2.6 disp_ReadWord(command, dummy)

Syntax	<code>disp_ReadWord("command", "dummy");</code>
Arguments	command, dummy
	command Specifies the value to be read from the display data register
	dummy Dummy byte required by for LCD read command
Returns	Returns 16 bit value in the register.
Description	Read a word from the display controller.
Example	<pre>var val; val := disp_ReadWord(0, 0); // Notes: // - Many displays are write only // - Some SPI displays required the command be given as part of the read sequence. // - Use -1 if no command is to be written.</pre>

2.2.7 disp_Sync(line)

Syntax	disp_Sync(line);	
Arguments	line	
	line	Scan line
Returns	Returns 16 bit value in the register.	
Description	<p>Allows the program to synchronise writing to the hardware for flicker free operation. Some experimentation may be needed to find an optimum line for disp_Sync depending on the graphics operation. The higher the value, the slower the throughput. A certain point will be reached (number of scanlines + blanking lines within the vertical retrace period) where it will just 'hang up' stopping the entire process. Eg, in 640x480 mode, if the 'lines' value is 507, operation will be slowest (as it's actually right at the end of the blanking period) and 508 will cause a hangup situation as it is above the highest scanline value.</p> <p>Note: Applies to 4.3" modules only.</p>	

2.2.8 disp_Disconnect()

Syntax	<code>disp_Disconnect();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	This function disconnects the display driver pins and/or reconfigures it to achieve its lowest possible power consumption. Use after disabling peripheral power to ensure the minimal power usage by the display. <code>disp_Init()</code> should be used to reinitialise the display.

2.2.9 disp_Init()

Syntax	<code>disp_Init();</code>
Arguments	none
Returns	nothing
Description	This function is used to initialise the display. This is useful in a number of situations, however mainly for modules which have the ability to disable the power supply to the display for low power sleep modes. This function is required to re-initialise the display once power to the display has been restored, so the display is usable once again.

2.3. FAT16 File Functions

Summary of functions in this section:

- file_Error()
- file_Count(filename)
- file_Dir(filename)
- file_FindFirst(fname)
- file_FindNext()
- file_Exists(fname)
- file_Open(fname, mode)
- file_Close(handle)
- file_Read(destination, size, handle)
- file_Seek(handle, HiWord, LoWord)
- file_Index(handle, Hisize, LoSize, recordnum)
- file_Tell(handle, &HiWord, &LoWord)
- file_Write(*source, size, handle)
- file_Size(handle, &HiWord, &LoWord)
- file_Image(x, y, handle)
- file_ScreenCapture(x, y, width, height, handle)
- file_PutC(char, handle)
- file_GetC(handle)
- file_PutW(word, handle)
- file_GetW(handle)
- file_PutS(*source, handle)
- file_GetS(*string, size, handle)
- file_Erase(fname)
- file_Rewind(handle)
- file_LoadFunction(fname.4XE)
- file_Run(fname.4XE, arglistptr)
- file_Exec(fname.4XE, arglistptr)
- file_LoadImageControl(fname1, fname2, mode)
- file_Mount()
- file_MountSpeed(speed)
- file_Unmount()
- file_PlayWAV(fname)
- file_CheckUpdate(filename, options)

2.3.1 file_Error()

Syntax	file_Error();		
Arguments	none		
Returns	Error Code		
	ERROR CODE	ERROR NUMBER	ERROR DESCRIPTION
FE_OK	0	IDE Function Succeeded	
FE_IDE_ERROR	1	IDE command execution error	
FE_NOT_PRESENT	2	CARD not present	
FE_PARTITION_TYPE	3	WRONG partition type, not FAT16	
FE_INVALID_MBR	4	MBR sector invalid signature	
FE_INVALID_BR	5	Boot Record invalid signature	
FE_MEDIA_NOT_MNTD	6	Media not mounted	
FE_FILE_NOT_FOUND	7	File not found in open for read	
FE_INVALID_FILE	8	File not open	
FE_FAT_EOF	9	Fat attempt to read beyond EOF	
FE_EOF	10	Reached the end of file	
FE_INVALID_CLUSTER	11	Invalid cluster value > maxcls	
FE_DIR_FULL	12	All root dir entry are taken	
FE_MEDIA_FULL	13	All clusters in partition are taken	
FE_FILE_OVERWRITE	14	A file with same name exist already	
FE_CANNOT_INIT	15	Cannot init the CARD	
FE_CANNOT_READ_MBR	16	Cannot read the MBR	
FE_MALLOC_FAILED	17	Malloc could not allocate the FILE struct	
FE_INVALID_MODE	18	Mode was not r.w.	
FE_FIND_ERROR	19	Failure during FILE search	
FE_INVALID_FNAME	20	Invalid Filename	
FE_INVALID_MEDIA	21	bad media	
FE_SECTOR_READ_FAIL	22	Sector Read fail	
FE_SECTOR_WRITE_FAIL	23	Sector write fail	
Description	Returns the most recent error code or 0 if there were no errors.		
Example	e := file_Error();		

2.3.2 file_Count(filename)

Syntax	file_Count(filename);	
Arguments	filename	
	filename	Name of the file(s) for the search (passed as a string)
Returns	Count	
	Count	Number of files that match the criteria.
Description	<p>Returns number of files found that match the criteria. The wild card character '*' matches up with any combination of allowable characters and '?' matches up with any single allowable character.</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>count := file_Count("*.4XE"); //Returns number of files with ".4XE"</pre>	

2.3.3 file_Dir(filename)

Syntax	<code>file_Dir(filename);</code>	
Arguments	filename	
	filename	Name of the file(s) for the search (passed as a string)
Returns	Count	
	Count	Number of files found that match the criteria.
Description	Streams a string of file names that agree with the search key. Returns number of files found that match the criteria. The wild card character '*' matches up with any combination of allowable characters and '?' matches up with any single allowable character. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>count := file_Dir("*.4XE"); //Returns number of files with ".4XE".</code>	

2.3.4 file_FindFirst(fname)

Syntax	file_FindFirst(fname);	
Arguments	fname	
	fname	Name of the file(s) for the search (passed as a string)
Returns	Status	
	Status	1: If at least one file exists that satisfies the criteria. 0: If no file satisfies the criteria.
Description	<p>Returns true if at least one file exists that satisfies the file argument. Wildcards are usually used so if file_FindFirst returns true, further tests can be made using file_FindNext() to find all the files that match the wildcard class. Note that the stream behaviour is the same as file_Dir().</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>if (file_FindFirst("*.4XE")) print("File Found") ; endif</pre>	

2.3.5 file_FindNext()

Syntax	file_FindNext();	
Arguments	none	
Returns	Status	
	Status	1: If more files exist that satisfy the criteria set in the file_FindFirst(fname). 0: If no more files satisfy the criteria set in the file_FindFirst(fname)
Description	<p>Returns true if more file exists that satisfies the file argument that was given for file_FindFirst. Wildcards must be used for file_FindFirst(), else this function will always return zero as the only occurrence will have already been found.</p> <p>Note that the stream behaviour is the same as file_Dir().</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>while ((file_FindNext ()) filecount++; wend</pre>	

2.3.6 file_Exists(fname)

Syntax	file_Exists(fname);	
Arguments	fname	
	fname	Name of the file for the search (passed as a string)
Returns	Status	
	Status	1: File found 0: File not found
Description	Tests for the existence of the file provided with the search key. Returns TRUE if found. Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre>if (file_Exists("fill.4XE")) print("File Found") ; endif</pre>	

2.3.7 file_Open(fname, mode)

Syntax	file_Open(fname, mode);	
Arguments	fname, mode	
	fname	Name of the file to be opened (passed as a string)
	mode	FILE_READ: 'r' FILE_WRITE: 'w' FILE_APPEND: 'a'
Returns	handle	
	handle	Returns handle if file exists. Sets internal file error number accordingly (0 if no errors).
Description	<p>Returns handle if file exists. The file "handle" created is now used as reference for "filename" for further file functions such as file_Close(), etc. For FILE_WRITE and FILE_APPEND modes ('w' and 'a') the file is created if it does not exist.</p> <p>If the file is opened for append and it already exists, the file pointer is set to the end of the file ready for appending, else the file pointer will be set to the start of the newly created file.</p> <p>If the file was opened successfully, the internal error number is set to 0 (ie: - no errors) and can be read with the file_Error() function..</p> <p>For FILE_READ mode ('r') the file must exist else a null handle (0) is returned and the 'file not found' error number is set which can be read with the file_Error() function.</p> <p>Note: If a file is opened for write mode 'w', and the file already exists, the operation will fail. Unlike C and some other languages where the file will be erased ready for re-writing when opened for writing, 4DGL offers a simple level of protection that ensures that a file must be purposely erased before being re-written.</p> <p>Note: Beginning with the v4.0 PmmC a file opened with FILE_APPEND may be randomly read and or written. Also any altered file will have the Archive bit set in the directory entry.</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>handle := file_Open("myfile.txt", 'r');</pre>	

2.3.8 file_Close(handle)

Syntax	file_Close(handle);	
Arguments	handle	
	handle	the file handle that was created by file_Open("fname") which is now used as reference (handle) for "fname" for further file functions such as in this function to close the file.
Returns	Status	
	Status	Returns TRUE if file closed, FALSE if not.
Description	Closes file created by file_Open() . Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Close(hndl);</code>	

2.3.9 file_Read(destination, size, handle)

Syntax	<code>file_Read(*destination, size, handle);</code>	
Arguments	destination, size, handle	
	destination	Destination memory buffer, this is a normal word aligned address
	size	Number of bytes to be read
	handle	The handle that references the file to be read.
Returns	count	
	count	Returns the number of characters read.
Description	Reads the number of bytes specified by "size" from the file referenced by "handle" into a destination memory buffer. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Read(memblock, 20, hndl);</code>	

2.3.10 file_Seek(handle, HiWord, LoWord)

Syntax	file_Seek(handle, HiWord, LoWord);	
Arguments	handle, HiWord, LoWord	
	handle	The handle that references the file
	HiWord	Contains the upper 16bits of the memory pointer into the file
	LoWord	Contains the lower 16bits of the memory pointer into the file
Returns	Status	
	Status	Returns TRUE if ok, usually ignored
Description	Places the file pointer at the required position in a file that has been opened in 'r' (read) or 'a' (append) mode. In append mode, file_Seek does not expand a filesize, instead, the file pointer (handle) is set to the end position of the file, eg:- assuming the file size is 10000 bytes, file_Seek(handle, 0, 0x1234); will set the file position to 0x00001234 (byte position 4660) for the file handle, so subsequent data may be read from that position onwards with file_GetC(...), file_GetW(...), file_GetS(...), or an image can be displayed with file_Image(...). Conversely, file_PutC(...), file_PutW(...) and file_PutS(...) can write to the file at the position. A FE_EOF (end of file error) will occur if you try to write or read past the end of the file.	
	Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre>res := file_Seek(hSource, 0x0000, 0x1234);</pre>	

2.3.11 file_Index(handle, Hisize, LoSize, recordnum)

Syntax	<code>file_Index(handle, Hisize, LoSize, recordnum);</code>	
Arguments	handle, Hisize, LoSize, recordnum	
	handle	The handle that references the file
	Hisize	Contains the upper 16bits of the size of the file records.
	LoSize	Contains the lower 16bits of the size of the file records.
	recordnum	The index of the required record
Returns	Status	
	Status	Returns TRUE if ok, usually ignored
Description	Places the file pointer at the position in a file that has been opened in 'r' (read) or 'a' (append) mode. In append mode, file_Index does not expand a filesize, instead, the file pointer (handle) is set to the end position of the file, eg:- assuming the record size is 100 bytes, file_Index(handle, 0, 100, 22); will set the file position to 2200 for the file handle, so subsequent data may be read from that position onwards with file_GetC(...), file_GetW(...), file_GetS(...), or an image can be displayed with file_Image(...). Conversely, file_PutC(...), file_PutW(...) and file_PutS(...) can write to the file at the position. A FE_EOF (end of file error) will occur if you try to write or read past the end of the file. Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre>res := file_Index(hSource, 0, 100, 22) ;</pre>	

2.3.12 file_Tell(handle, &HiWord, &LoWord)

Syntax	file_Tell(handle, &HiWord, &LoWord);	
Arguments	handle, &HiWord, &LoWord	
	handle	The handle that references the file
	HiWord	Contains the upper 16bits of the memory pointer into the file
	LoWord	Contains the lower 16bits of the memory pointer into the file
Returns	Status	
	Status	Returns TRUE if ok, usually ignored
Description	Returns the current value of the file pointer. Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre>res := file_Tell(hSource, HIptr, LOptr) ;</pre>	

2.3.13 file_Write(*source, size, handle)

Syntax	<code>file_Write(*source, size, handle);</code>	
Arguments	source, size, handle	
	source	Source memory buffer, this is a byte aligned string pointer
	size	Number of bytes to be written.
	handle	The handle that references the file to write.
Returns	count	
	count	Returns the number of bytes written.
Description	Writes the number of bytes specified by "size" from the source buffer into the file referenced by "handle". Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Write(memblock, 20, hndl1);</code>	

2.3.14 file_Size(handle, &HiWord, &LoWord)

Syntax	<code>file_Size(handle, &HiWord, &LoWord);</code>	
Arguments	handle, HiWord, LoWord	
	handle	The handle that references the file.
	HiWord	Contains the upper 16bits of the file size.
	LoWord	Contains the lower 16bits of the file size.
Returns	Status	
	Status	Returns TRUE if ok, usually ignored.
Description	Reads the 32 bit file size and stores it into two variables	
	Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Size(hSource, sizeHi, sizeLo);</code>	

2.3.15 file_Image(x, y, handle)

Syntax	<code>file_Image(x, y, handle);</code>
Arguments	x, y, handle
	x X-position of the image to be displayed
	y Y-position of the image to be displayed
	handle The handle that references the file containing the image(s)
Returns	Returns a copy of the <code>file_Error()</code> error code
Description	Display an image from the file stream at screen location specified by x, y (top left corner). If there is more than 1 image in the file, it can be accessed with <code>file_Seek(...)</code> . Note: This function is only available for use on the uSD based PmmC version.
Example	<code>file_Image(x, y, handle);</code>

2.3.16 file_ScreenCapture(x, y, width, height, handle)

Syntax	file_ScreenCapture(x, y, width, height, handle);	
Arguments	x, y, width, height, handle	
	x	X-position of the image to be captured
	y	Y-position of the image to be captured
	width	Width of the area to be captured.
	height	Height of the area to be captured.
	handle	The handle that references the file to store the image(s)
Returns	Status	
	Status	Returns 0 if function successful.
Description	Save an image of the screen shot to file at the current file position. The image can later be displayed with file_Image(...) . The file may be opened in append mode to accumulate multiple images. Later, the images can be displayed with file_Seek(...) . The image is saved from x, y (with respect to top left corner), and the capture area is determined by "width" and "height". Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre> file_Mount(); hFile := file_Open("test.img", 'a'); // open a file to save the image file_ScreenCapture(20,20,100,100, hFile); // save an area file_ScreenCapture(0,0,50,50, hFile); // (save another area) file_Close(hFile); // now close the file // and to display the saved area(s) hFile := file_Open("test.img", 'r'); // open the saved file file_Image(20,180, hFile); // display the image file_Image(150,180, hFile); // (display the next image) file_Close(hFile); file_Unmount(); // finished with file system </pre>	

2.3.17 file_PutC(char, handle)

Syntax	<code>file_PutC(char, handle);</code>	
Arguments	char, handle	
	char	Data byte about to be written.
	handle	The handle that references the file to be written to.
Returns	BytesWritten	
	BytesWritten	Returns the number of bytes written
Description	This function writes the byte specified by "char" to the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 1). The file must be previously opened with 'w' (write) or 'a' (append) modes. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>file_PutC('A', hndl);</code>	

2.3.18 file_GetC(handle)

Syntax	file_GetC(handle);	
Arguments	handle	
	handle	The handle that references the file.
Returns	byte	
	byte	Returns the data byte read from the file.
Description	This function reads a byte from the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 1). The file must be previously opened with 'r' (read) mode. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>mychar := file_GetC(hndl);</code>	

2.3.19 file_PutW(word, handle)

Syntax	<code>file_PutW(word, handle);</code>	
Arguments	word, handle	
	word	Data about to be written
	handle	The handle that references the file to be written to.
Returns	BytesWritten	
	BytesWritten	Returns the number of bytes written
Description	This function writes word sized (2 bytes) data specified by " word " to the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 2). The file must be previously opened with 'w' (write) or 'a' (append) modes. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>file_PutW(0x1234, hndl);</code>	

2.3.20 file_GetW(handle)

Syntax	<code>file_GetW(handle);</code>	
Arguments	handle	
	handle	The handle that references the file.
Returns	Word	
	Word	Returns word sized data read from the file.
Description	This function reads a word (2 bytes) from the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 2). The file must be previously opened with 'r' (read) mode. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>myword := file_GetW(hndl);</code>	

2.3.21 file_PutS(*source, handle)

Syntax	<code>file_PutS(*source, handle);</code>	
Arguments	source, handle	
	source	A pointer to the string to be written.
	handle	The handle that references the file to be written to.
Returns	count	
	count	Returns the number of characters written (excluding the null terminator).
Description	This function writes an ASCIIZ (null terminated) string from a buffer specified by " *source " to the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately. The file must be previously opened with 'w' (write) or 'a' (append) modes. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>file_PutS(mystring, hndl);</code>	

2.3.22 file_GetS(*string, size, handle)

Syntax	<code>file_GetS(*string, size, handle);</code>	
Arguments	string, size, handle	
	string	Destination buffer
	size	The maximum number of bytes to be read from the file.
	handle	The handle that references the file.
Returns	Count	
	Count	Returns the number of characters read from file (excluding the null terminator)
Description	<p>This function reads a line of text to a buffer (specified by "*string") from a file at the current file position indicated by the associated file-position pointer and advances the pointer appropriately. Characters are read until either a newline or an EOF is received or until the specified maximum "size" is reached. In all cases, the string is null terminated. The file must be previously opened with 'r' (read) mode.</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<code>res := file_GetS(mystring, 80, hndl);</code>	

2.3.23 file_Erase(fname)

Syntax	<code>file_Erase(fname);</code>	
Arguments	fname	
	fname	Name of the file to be erased
Returns	Status	
	Status	Returns 1 if successful, otherwise 0
Description	This function erases a file on the disk. Note: Note: If the function fails, the appropriate error number is set in file_Error() and will usually be error 19, "failure during FILE search". Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Erase("myfile.txt");</code>	

2.3.24 file_Rewind(handle)

Syntax	<code>file_Rewind(handle);</code>	
Arguments	handle	
	handle	The handle that references the file
Returns	Status	
	Status	Returns TRUE if ok, usually ignored
Description	Resets the file pointer to the beginning of a file that has been opened in 'r' (read), 'w', or 'a' (append) mode. Note: This function is only available for use on the uSD based PmmC version.	
Example	<code>res := file_Rewind(hSource);</code>	

2.3.25 file_LoadFunction(fname.4XE)

Syntax	<code>file_LoadFunction(fname.4XE);</code>
Arguments	fname.4XE fname.4XE Name of the 4DGL application program that is about to be loaded into RAM.
Returns	Pointer Pointer Returns a pointer to the memory allocation where the function has been loaded from file which can be then used as a function call.
Description	<p>Load a function or program from disk and return a function pointer to the allocation. The function can then be invoked just like any other function would be called via a function pointer. Parameters may be passed to it in a conventional way. The function may be discarded at any time when no longer required, thus freeing its memory resources.</p> <p>The loaded function can be discarded with mem_Free(..). Note that any pointer references passed to the child function may not include references to the parents DATA statements or any static string references. Any string or array information must be in the parent's global or local memory space. The reason for this is that DATA statements and static strings are contained in the parents CODE segment, and cannot be accessed by the child process.</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>
Example1	<pre>var titlestring[20]; var textstring[20]; to(titlestring); putstr("My Window Title"); to (textstring); putstr("My Special Message"); popupWindow := file_LoadFunction("popupWindow1.4fn"); if(!popupWindow) goto LoadFunctionFailed;//could not load the function //then elsewhere in your program res := popupWindow(MYMODE,titlestring,textstring); if(res == QUIT_APPLICATION) goto exitApp; //Later in your program, when popupWindow is no longer required //for the application res := mem_Free(popupWindow); if(!res) goto FreeFunctionFailed; //should never happen if memory not //corrupted</pre>
Example2	<pre>var fncHandle; //a var for a handle to sliders2.4dg var slidervals; //reference var to access global vars in sliders.4dg fncHandle := file_LoadFunction("sliders2.4xe"); // load the function slidervals := fncHandle&0x7FFF; // note that memory allocations //for transient programs are biased with 8000h which must be removed. slidervals++; // note that all globals start at '1' slidervals[0] := 25; // set sliders to initial positions slidervals[1] := 20; slidervals[2] := 30; slidervals[3] := 15; slidervals[4] := 35; slidervals[5] := 20; slidervals[6] := 40;</pre>

```
slidervals[7] := 25;
slidervals[8] := 45;
slidervals[9] := 5;

r := fncHandle();      // activate the function

print("Return value = 0x", [HEX] r,"\\n");

// print the values, they may have changed
print("Slider 1 ", slidervals[0]," Slider 2 ", slidervals[1],"\\n");
print("Slider 3 ", slidervals[2]," Slider 4 ", slidervals[3],"\\n");
print("Slider 5 ", slidervals[4]," Slider 6 ", slidervals[5],"\\n");
print("Slider 7 ", slidervals[6]," Slider 8 ", slidervals[7],"\\n");
print("Slider 9 ", slidervals[8]," Slider 10 ", slidervals[9],"\\n");

mem_Free(fncHandle); // done with sliders, release its memory
```

2.3.26 file_Run(fname.4XE, arglistptr)

Syntax	file_Run(fname.4XE, arglistptr);	
Arguments	fname.4XE , arglistptr	
	fname.4XE	Name of the 4DGL child program to be loaded into RAM and executed.
	arglistptr	Pointer to the list of arguments to pass to the new program.
Returns	Value	
	Value	Returns the value from main in the called program.
Description	<p>Any memory allocations in the main FLASH program are released, however, the stack and globals are maintained.</p> <p>The function 'main' in the called program accepts the arguments, if any. If arglistptr is 0, no arguments are passed, else arglistptr points to an array, the first element containing the number of additional elements in the array which contain the arguments.</p> <p>The disk does not need to be mounted, file_Run automatically mounts the drive.</p> <p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>#inherit "4DGL_16bitColours.fnc" #inherit "FONT4.fnt" #constant MAXBUTTONS 30 // for now, maximum number of buttons we want // (also sets maximum number of files we can exec) #STACK 500 //stack must be large enough to be shared with called program #MODE RUNFLASH // This is a 'top down' main program and must be run from FLASH //----- // local global variables //----- // NB:- demo assigns all arrays to MAXBUTTONS. // The arrays could be dynamically assigned to minimise memory usage. // There is break even point between extra code and smallish arrays. var keyval; // 0 if no key pressed else 1-n var filenames; // pointer to byte array that holds the filenames var buttontexts[MAXBUTTONS]; // pointers into the filenames array //holds the filenames we use as button text var vButtonState[MAXBUTTONS]; //button state flag(bit 0 = up:down state) var vOldButtonState[MAXBUTTONS]; // OLD button state flags (bit 0 = up:down state) // (we keep 2 copies so we can test for a state change and only redraw when // a state change occurs) var touchX1[MAXBUTTONS]; // touch regions for the buttons var touchY1[MAXBUTTONS]; var touchX2[MAXBUTTONS]; var touchY2[MAXBUTTONS];</pre>	

```
var btnTextColor;           // button text colour
var btnBtnColor;          // button background colour
var buttoncount;          // actual number of buttons created (set
by number of *.4XE files we find on drive)

var tempstr[20];          // general purpose string, 40 bytes

#DATA
byte fred 1,2,3,4,5,6,7,8,9,10,11,12
#END

/*=====
Redraw the button matrix. Only draw buttons that have changed state.
The top left corner of the button matrix is set with the xorg and yorg
parameters depending on the font and text string width, the button matrix
dynamically resizes.

Parameters:-
maxwidth      = rhs from xorg (in pixels) to cause wrap at rhs
maxwidth      = maximum matrix width (in pixel units)
buttoncount   = number of buttons to display
font          = FONT1 to FONT4
xorg:yorg     = top left corner of button array
NB:- The touch detect matrix array is updated when any button changes state.
When you need to draw the matrix for the first instance of the matrix, you
must
call with mode = 1 to instantiate the buttons.
call with mode = 0 for normal button action.
=====*/

endfunc
//=====
```

2.3.27 file_Exec(fname.4XE, arglistptr)

Syntax	file_Exec(fname.4XE, arglistptr);	
Arguments	fname.4XE, arglistptr	
	fname.4XE	Name of the 4DGL child program to be loaded into RAM and executed.
	arglistptr	Pointer to the list of arguments to pass to the new program or 0 if no arguments.
Returns	Value	
	Value	Returns the value from main in the called program.
Description	This function is similar to file_Run, however, the main program in FLASH retains all memory allocations (eg file buffers, memory allocated with mem_Alloc etc) Note: This function is only available for use on the uSD based PmmC version.	
Example	Main Program: <pre> var args[4], l[50] ; func main() var i ; putstr("Mounting...\n"); // must mount uSD for file_Exec if (!(file_Mount())) while(!(file_Mount())) putstr("Drive not mounted...\n"); pause(200); gfx_Cls(); pause(200); wend endif for (i := 0; i < sizeof(l); i++) // init array that will be passed l[i] := i ; next args[0] := 2 ; // init arg count args[1] := 1234 ; // init arg 1, this cannot be changed args[2] := l ; // init arg 2 to address of l print("main Program\n"); i := file_Exec("uSDProg.4fn", args) ; print("Back in main program\n"); print("uSD Program returned ", i, "\n") ; // number from return statement for (i := 0; i < sizeof(l); i++) // find what changed in array if (l[i] != i) print("l[", i, "] was changed to ", l[i], "\n"); next print("Done") ; repeat forever endfunc Function on uSD: func main(var j, var *l) // parameters appear in the normal way // The * shows that l will be indexed. It </pre>	

```
// simply stops the compiler issuing a 'notice'  
txt_FGcolour(WHITE);  
print("In file_Exec's Program\n") ;  
print("Parms=", j, " ", l, "(ptr to l)\n") ; // can't change these  
print("Incrementing l[5] to ", ++l[5], "\n") ; // can change these  
print("Returning 188\n") ; // can return a value  
txt_FGcolour(LIME);  
return 188 ;  
endfunc
```

2.3.28 file_LoadImageControl(fname1, fname2, mode)

Syntax	file_LoadImageControl(fname1, fname2, mode);													
Arguments	fname1, fname2, mode													
	fname1	The control list filename "*.dat". Created from Graphics Composer.												
	fname2	The image filename "*.gci". Created from Graphics Composer.												
	Mode 0 : It is assumed that there is a graphics file with the file extension "fname2.gci". In this case, the images have been stored in a FAT16 file concurrently, and the offsets that are derived from the "fname1.dat" file are saved in the image control so that the image control can open the file (*.gci) and use file_Seek(..) to get to the position of the image which can then automatically be displayed using file_Image(xpos, ypos, hSource). Mode 0 builds the image control quickly as it only scans the *.dat file for the file offsets and saves them in the relevant entries in the image control. The penalty is that images take longer to find when displayed due to file_Seek(..) overheads.													
	Mode 1 : It is assumed that there is a graphics file with the file extension "fname2.gci". In this case, the images have been stored in a FAT16 file concurrently, and the offset of the images are saved in the image control so that image file (*.gci) can be mapped to directly. The absolute cluster/sector is mapped so file seek does not need to be called internally. This means that there is no seek time penalty, however, the image list takes a lot longer to build, as all the seeking is done at control build time.													
	Mode 2 : In this case, the images have been stored in a RAW partition of the uSD card, and the absolute address of the images are saved in the DAT file. This is the fastest operation of the image control as there is no seeking or other disk activity taking place.													
	Mode 3 : This mode is for Flash based 'file system' GCI (GCIF) with integrated DAT and other file types. "fname1" and "fname2" are then the Flash high and low words of the GFIC start location.													
Returns	Status													
	Status	Returns a handle (pointer to the memory allocation) to the image control list that has been created. Returns NULL if function fails.												
Description	Reads a control file to create an image list. When an image control is loaded, an array is built in RAM. It consists of a 6 word header with the following entries as defined by the constants: <table> <tbody> <tr> <td>IMG_COUNT</td> <td>0</td> </tr> <tr> <td>IMG_ENTRYLEN</td> <td>1</td> </tr> <tr> <td>IMG_MODE</td> <td>2</td> </tr> <tr> <td>IMG_GCI_FILENAME</td> <td>3</td> </tr> <tr> <td>IMG_DAT_FILENAME</td> <td>4</td> </tr> <tr> <td>IMG_GCIFILE_HANDLE</td> <td>5</td> </tr> </tbody> </table>		IMG_COUNT	0	IMG_ENTRYLEN	1	IMG_MODE	2	IMG_GCI_FILENAME	3	IMG_DAT_FILENAME	4	IMG_GCIFILE_HANDLE	5
IMG_COUNT	0													
IMG_ENTRYLEN	1													
IMG_MODE	2													
IMG_GCI_FILENAME	3													
IMG_DAT_FILENAME	4													
IMG_GCIFILE_HANDLE	5													

No images are stored in FLASH or RAM, the image control holds the index values for the absolute storage positions on the uSD card for RAW mode, or the cluster/sector position for formatted FAT16 mode.

When an image control is no longer required, the memory can be released with **mem_Free()**;

Example	<pre>#inherit "4DGL_16bitColours.fnc" #constant OK 1 #constant FAIL 0 var p; // buffer pointer var img; // handle for the image list var n, exit, r; //----- // return true if screen touched, also sets ok flag func CheckTouchExit() return (exit := (touch_Get(TOUCH_STATUS) == TOUCH_PRESSED)); // if there's a press, exit endfunc //----- func main() gfx_Cls(); txt_Set(FONT_ID, FONT2); txt_Set(TEXT_OPACITY, OPAQUE); touch_Set(TOUCH_ENABLE); // enable the touch screen print("heap=", mem_Heap(), " bytes\n"); // show the heap size r := OK; // return value exit := 0; if (!file_Mount()) print("File error ", file_Error()); while(!CheckTouchExit()); // just hang if we didnt get the image list r := FAIL; goto quit; endif print ("WAIT...building image list\n"); // slow build, fast execution, higher memory requirement img := file_LoadImageControl("GFX2DEMO.dat", "GFX2DEMO.gci", 1); // build image control, returning a pointer to structure allocation if (img) print("image control=[HEX] img,\n"); // show the address of the image control allocation else putstr("Failed to build image control....\n"); while(CheckTouchExit() == 0); // just hang if we didnt get the image list r := FAIL; goto quit; endif print ("Loaded ", img[IMG_COUNT], " images\n"); print ("\nTouch and hold to exit...\n"); pause(2000);</pre>
----------------	--

```
    pause(3000);
    gfx_Cls();

    repeat
        n := 0;

        while(n < img[IMG_COUNT] && !exit) // go through all images

            CheckTouchExit();           // if there's a press, exit

            img_SetPosition( img, n, (ABS(RAND() % 240)), (ABS(RAND() % 320))); // spread out the images

            n++;

        wend

        img_Show(img, ALL);         // update the entire control in 1 hit

    until(exit);

quit:

    mem_Free(img);             // release the image control

    file_Unmount();             // (program must release all resources)

    return r;

endfunc
//=====
```

2.3.29 file_Mount()

Syntax	file_Mount();	
Arguments	none	
Returns	Status	
	Status	Returns true if successful
Description	Starts up the FAT16 disk file services and allocates a small 32 byte control block for subsequent use. When you open a file using file_Open(..) , a further $512 + 44 = 556$ bytes are attached to the FAT16 file control block. When you close a file using file_Close(..) , the 556 byte allocation is released leaving the 32 byte file control block. The file_Mount() function must be called before any other FAT16 file related functions can be used. The control block and all FAT16 file resources are completely released with file_Unmount() .	
Example	<pre>if(!file_Mount()) while(!file_Mount()) putstr("Disk not mounted"); pause(200); gfx_Cls(); pause(200); wend endif</pre>	

2.3.30 file_MountSpeed(speed)

Syntax	file_MountSpeed(speed);	
Arguments	speed	
	speed	Specifies the speed. Speed can be from SPI_SPEED0 (slowest) to SPI_SPEED15 (fastest).
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Returns true if successful.
Description	Creates a control block for FAT16 and mounts the File System at the specified speed.	
Example	<pre>if(!file_MountSpeed(SPI_SPEED0)) repeat putstr("Disk not mounted"); pause(200); gfx_Cls(); pause(200); until(file_MountSpeed(SPI_SPEED0)); endif</pre>	

2.3.31 file_Unmount()

Syntax	<code>file_Unmount();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Release any buffers for FAT16 and unmount the Disk File System. This function is to be called to close the FAT16 file system. Note: This function is only available for use on the uSD based PmmC version.
Example	<code>file_Unmount();</code>

2.3.32 file_PlayWAV(fname)

Syntax	file_PlayWAV(fname);	
Arguments	fname	
	fname	Name of the wav file to be opened and played
Returns	value	
	value	<p>If there are no errors, returns number of blocks to play (1 to 32767) If errors occurred, the following is returned:</p> <ul style="list-style-type: none"> -7 : Insufficient memory available for WAV buffer and file -6 : cant play this rate -5 : no data chunk found in first rsector -4 : no format data -3 : no wave chunk signature -2 : bad wave file format -1 : file not found
Description	Open the wav file, decode the header to set the appropriate wave player parameters and set off the playing of the file as a background process. See Sound Control Functions for additional play control functions.	
	<p>Note: This function is only available for use on the uSD based PmmC version.</p>	
Example	<pre>print("\nding.wav\n"); for(n:=0; n<45; n++) pitch := NOTES[n]; print([UDEC] pitch,"\\r"); snd_Pitch(pitch); file_PlayWAV("ding.wav"); while(snd_Playing()); //pause(500); next</pre>	

2.3.33 file_CheckUpdate(filename, options)

Syntax	file_CheckUpdate(filename, options)	
Arguments	filename, options	
	filename	Name of the 4DGL program on the uSD card
	options	<p>Program update options:</p> <p>CHECKUPDATE_QUERY 1 Checks the specified file and compares its DateTime to the program running in Flash.</p> <p>CHECKUPDATE_UPDATENEWER 2 Updates the program in Flash if the program on uSD is newer.</p> <p>CHECKUPDATE_UPDATEALWAYS 3 Always updates the program in Flash.</p>
Returns	value	
	value	<p>If update occurs and the program is running from Flash, as display is reset after update. Otherwise if a query or an error occurs, the following is returned:</p> <p>CHECKUPDATE_NEWFILE 1 The specified file is newer than the file running in Flash.</p> <p>CHECKUPDATE_OLDFILE 2 The specified file is equal to or older than the file running in Flash.</p> <p>CHECKUPDATE_UPDATEDONE 3 An update was performed and the program is running from RAM.</p> <p>CHECKUPDATE_NOFILE 4 The specified file does not exist.</p> <p>CHECKUPDATE_INVALIDFILE 5 The specified file is not a valid .4xe or .4fn</p>
Description	Checks and/or updates the program running in Flash using the specified file on uSD. Note: This function is only available for use on the uSD based PmmC version.	
Example	<pre> if (!file_Mount()) while(!file_Mount()) putstr("Drive not mounted..."); pause(200); gfx_Cls(); pause(200); wend endif if (file_CheckUpdate("Program.4xe",CHECKUPDATE_QUERY)==CHECKUPDATE_NEWFILE) putstr("Program will now update"); file_CheckUpdate("Program.4xe", CHECKUPDATE_UPDATENEWER); endif </pre>	

2.4. Flash Memory Functions

The functions in this section apply to the external SPI Flash memory device and is only available for use with the Flash-based PmmC.

- flash_SIG()
- flash_ID()
- flash_BulkErase()
- flash_Block32Erase()
- flash_Block64Erase()
- flash_Sector4Erase()

Note: The Flash memory chip should be mounted using **media_Init()** to use these functions

2.4.1 flash_SIG()

Syntax	flash_SIG();	
Arguments	none	
Returns	Signature	
	Signature	Returns the Flash Signature returned from the 'FLASH WAKEUP RETURN SIG' (0xAB) command.
Description	Read JEDEC signature from SPI Flash device. Note: This function is only available for use on the Flash based PmmC version.	
Example	<pre>var signature; signature := flash_SIG(); print("JEDEC Signature: ", signature);</pre>	

2.4.2 flash_ID()

Syntax	flash_ID();	
Arguments	none	
Returns	ID	
	ID	Returns the second (memory type) and third (memory capacity) bytes returned from the 'FLASH READ ID REG' (0x9F) command.
Description	Read ID code from SPI Flash device. Note: This function is only available for use on the Flash based PmmC version.	
Example	<pre>var ID; ID := flash_ID(); print("Memory type: ", [HEX] HIbyte(ID), "\n"); print("Capacity: ", [HEX] LObyte(ID));</pre>	

2.4.3 flash_BulkErase()

Syntax	<code>flash_BulkErase();</code>
Arguments	<code>none</code>
Returns	<code>none</code>
Description	Erase entire SPI Flash device. Note: This function is only available for use on the Flash based PmmC version.
Example	<code>flash_BulkErase();</code>

2.4.4 flash_Block32Erase()

Syntax	<code>flash_Block32Erase();</code>
Arguments	<code>none</code>
Returns	<code>none</code>
Description	Erase the 32KB flash block including the currently set address. This uses the 0x52 command.
Note: This function is only available for use on the Flash based PmmC version.	
Example	<code>flash_Block32Erase();</code>

2.4.5 flash_Block64Erase()

Syntax	<code>flash_Block64Erase();</code>
Arguments	<code>none</code>
Returns	<code>none</code>
Description	Erase the 64KB flash block including the currently set address. This uses the 0xD8 command.
Note: This function is only available for use on the Flash based PmmC version.	
Example	<code>flash_Block64Erase();</code>

2.4.6 flash_Sector4Erase()

Syntax	<code>flash_Sector4Erase();</code>
Arguments	<code>none</code>
Returns	<code>none</code>
Description	Erase the 4KB flash sector including the currently set address. This uses the 0x20 command. Note: This function is only available for use on the Flash based PmmC version.
Example	<code>flash_Sector4Erase();</code>

2.5. Internal Flash Functions

The functions in this section relate to Pixxi-44 only.

Pixxi-44 with PmmC revision 21 and above has 2048 bytes of internal flash available for saving user variables and data.

The following functions can make use of this internal flash.

Summary of Functions in this section:

- intflash_GetByte(ptr);
- intflash_GetWord(ptr);
- intflash_Copy(ptr, dest, count);
- intflash_WriteBlock(sourceptr, size);
- intflash_FunctionCall();
- intflash_FunctionFreeCache();

2.5.1 intflash_GetByte(ptr)

Syntax	<code>intflash_GetByte(ptr);</code>	
Arguments	ptr	
	ptr	Pointer to a location in the internal flash
	The arguments can be a variable, array element, expression or constant (0 ... 2047 range)	
Returns	byte	
	byte	The byte value from the location
Description	Reads a single byte from internal flash.	
Example	<pre>var myvar; myvar := intflash_GetByte(0); // read the 0th byte from internal flash</pre>	

2.5.2 intflash_GetWord(ptr)

Syntax	<code>intflash_GetWord(ptr);</code>	
Arguments	ptr	
	ptr	Pointer to a location in the internal flash
	The arguments can be a variable, array element, expression or constant (0 ... 1023 range)	
Returns	byte	
	byte	The byte value from the location
Description	Reads a single word from any internal flash location. The pointer is byte aligned.	
Example	<pre>var myvar; myvar := intflash_GetWord(0x0000); // read first word from internal flash</pre>	

2.5.3 intflash_Copy(ptr, dest, count)

Syntax	<code>intflash_Copy(ptr, dest, count);</code>	
Arguments	ptr	
	ptr	Pointer to a location in the internal flash (0 ... 2047 range)
	dest	Pointer to the destination. The destination pointer is word aligned. (0 ... 1023 range)
	count	Count of bytes to be transferred. (0 ... 2047 range)
	The arguments can be a variable, array element, expression or constant	
Returns	count	
	count	The count of bytes transferred.
Description	Copies bytes from any internal flash locations to a user buffer. The destination pointer is byte aligned, so a str_Ptr must be raised to get correct address.	
Example	<pre>var myvar; var mybuf[100]; // read 20 bytes from internal flash starting from 0x123 myvar := intflash_Copy(0x123, mybuf, 20);</pre>	

2.5.4 intflash_WriteBlock(sourceptr, size)

Syntax	intflash_WriteBlock(sourceptr, size);	
Arguments	Sourceptr, size	
	sourceptr	Source buffer to save up to 2K bytes of data from.
	size	The number of bytes to be written
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Returns true if the function succeeded.
Description	Copies a buffer to NVM. Size bytes are written. A maximum of 2048 bytes can be written.	
Example	<pre>var result; result := intflash_WriteBlock(buffer); // store the 2k buffer</pre>	

2.5.5 intflash_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap)

Syntax	intflash_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap);	
Arguments	handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap	
	handle	Widget pointer allocated using widget_LoadFlash()
	index	Index of the entry in the handle
	state	Value passed to update function state
	&FunctionRam	Pointer to the function RAM allocation
	&FunctionDef	Pointer to the function definitions stored in Flash
	FunctionArgCount	Function argument count
	FunctionArgStringMap	String address array
Returns	value	
	value	Returns 0 if successful
Description	<p>This function loads and calls the Function found at index in Internal Flash</p> <p>Parameters "state", "&FunctionRam", "&FunctionDef", "&FunctionDef" are passed. The first two parameters are passed "as is", since the third parameter is normally in flash and one programs flash is not accessible from another.</p> <p>The FunctionArgCount constant is copied into a RAM array and passed to the Function.</p> <p>The parameter FunctionStringMap is a bit array of the indexes containing single and multiple strings that are offset by 8. e.g. 0x0100 means parameter 8 is a single string, 0x0002 means parameter 9 is an array of strings with parameter 8 containing the count.</p> <p>Any function called this way is loaded into RAM and then left there. RAM is managed using a Least Recently Used (LRU) mechanism wherein the least recently used entry is freed if there is not enough Heap to load the desired function.</p>	
Example	<pre>#DATA word IIMediaRotaryDef 20, 4, 179, 179, 16, RED, BROWN, GRAY, GRAY, ORANGE, YELLOW, 0x30FE, 3, 75, 13, 120, 2, 135, 405 #END var IMediaRotaryRAM[WIDGET_RAM_SPACE]; var NewVal, hndl; void main() intflash_FunctionCall(hndl, index, state, IMediaRotaryRAM, IIMediaRotaryDef, 19, 0x0); repeat forever endfunc</pre>	

2.5.6 intflash_FunctionFreeCache(handle)

Syntax	<code>intflash_FunctionFreeCache(handle);</code>	
Arguments	handle	
	handle	Widget pointer allocated using <code>widget_LoadFlash()</code>
Returns	none	
Description	Frees any RAM allocated to caching of functions located in Internal Flash	
Example	<code>intflash_FunctionFreeCache(hndl);</code>	

2.6. General Purpose Functions

Summary of functions in this section:

- pause(time)
- lookup8(key, byteConstList)
- lookup16(key, wordConstList)
- rect_Intersect(&rect1, &rect2)
- rect_Within(&rect1, &rect2)

2.6.1 pause(time)

Syntax	pause(time);
Arguments	time
	time A value specifying the delay time in milliseconds. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Stop execution of the user program for a predetermined amount of time.
Example	if (status) // if fire button pressed pause(30) // slow down the loop else ...

2.6.2 lookup8(key, byteConstList)

Syntax	lookup8(key, byteConstList);	
Arguments	key, byteConstList	
key	A byte value to search for in a fixed list of constants. The key argument can be a variable, array element, expression or constant	
	byteConstList	A comma separated list of constants and strings to be matched against key . Note: The string of constants may be freely formed, see example.
Returns	result	
	result	See description.
Description	<p>Search a list of 8 bit constant values for a match with a search value key. If found, the index of the matching constant is returned in result, else result is set to zero. Thus, if the value is found first in the list, result is set to one. If second in the list, result is set to two etc. If not found, result is returned with zero.</p> <p>Note: The list of constants cannot be re-directed. The <code>lookup8(...)</code> functions offer a versatile way for returning an index for a given value. This can be very useful for data entry filtering and parameter input checking and where ever you need to check the validity of certain inputs. The entire search list field can be replaced with a single name if you use the \$ operator in constant, eg :</p> <pre>#constant HEXVALUES \$"0123456789ABCDEF"</pre>	
Example	<pre>func main() var key, r; key := 'a'; r := lookup8(key, 0x4D, "abcd", 2, 'Z', 5); print("\nSearch value 'a' \nfound as index ", r); key := 5; r := lookup8(key, 0x4D, "abcd", 2, 'Z', 5); print("\nSearch value 5 \nfound at index ", r); putstr("\nScanning..\n"); key := -12000; // we will count from -12000 to +12000, only // the hex ascii values will give a match value while(key <= 12000) r := lookup8(key, "0123456789ABCDEF"); // hex lookup if(r) print([HEX1] r-1); // only print if we got a match in // the table key++; wend repeat forever endfunc</pre>	

2.6.3 lookup16(key, wordConstList)

Syntax	lookup16(key, wordConstList);	
Arguments	key, wordConstList	
key	A word value to search for in a fixed list of constants. The key argument can be a variable, array element, expression or constant	
	wordConstList	A comma separated list of constants to be matched against key .
Returns	result	
	result	See description.
Description	<p>Search a list of 16 bit constant values for a match with a search value key. If found, the index of the matching constant is returned in result, else result is set to zero. Thus, if the value is found first in the list, result is set to one. If second in the list, result is set to two etc. If not found, result is returned with zero.</p> <p>Note: The lookup16(...) functions offer a versatile way for returning an index for a given value. This is very useful for parameter input checking and where ever you need to check the validity of certain values. The entire search list field can be replaced with a single name by using the \$ operator in constant, eg:</p> <pre>#constant LEGALVALS \$5,10,20,50,100,200,500,1000,2000,5000,10000</pre>	
Example	<pre>func main() var key, r; key := 5000; r := lookup16(key, 5,10,20,50,100,200,500,1000,2000,5000,10000); //r := lookup16(key, LEGALVALS); if(r) print("\nSearch value 5000 \nfound at index ", r); else putstr("\nValue not found"); endif print("\nOk"); // all done repeat forever endfunc</pre>	

2.6.4 rect_Intersect(&rect1, &rect2)

Syntax	rect_Intersect(&rect1, &rect2);	
Arguments	&rect1, &rect2	
	&rect1	An array of 4 vars, left, top, width, height.
	&rect2	An array of 4 vars, left, top, width, height.
Returns	True if any part of rect1 is within rect2, false if otherwise.	
Description	<p>This function detects if two rectangles intersect each other or not. It is ideal for use as a collision detector. Each rectangle is an array of four words in the format:</p> <p style="padding-left: 40px;">element 0 = RECT_LEFT element 1 = RECT_TOP element 2 = RECT_WIDTH element 3 = RECT_HEIGHT</p>	
Example	<pre>var rect1[4] := [50,50,75,75]; var rect2[4] := [20,20,100,100]; if(rect_Intersect(rect1, rect2)) print("rect1 intersects rect2\n"); else print("rect1 does not intersect rect2\n"); endif</pre>	

2.6.5 rect_Within(&rect1, &rect2)

Syntax	rect_Within(&rect1, &rect2);	
Arguments	&rect1, &rect2	
	&rect1	An array of 4 vars, left, top, width, height.
	&rect2	An array of 4 vars, left, top, width, height.
Returns	Returns true if rect1 is fully within rect2, false if otherwise	
Description	<p>This function detects if a certain rectangle is completely within another rectangle or not. Each rectangle is an array of four words in the format:</p> <p style="margin-left: 40px;">element 0 = RECT_LEFT element 1 = RECT_TOP element 2 = RECT_WIDTH element 3 = RECT_HEIGHT</p>	
Example	<pre>var rect1[4] := [50,50,25,25]; var rect2[4] := [20,20,100,100]; if(rect_Within(rect1, rect2)) print("rect1 is fully within rect2\n"); else print("rect1 is not fully within rect2\n"); endif</pre>	

2.7. GPIO Functions

Summary of functions in this section:

- pin_Set(mode, pin)
- pin_HI(pin)
- pin_LO(pin)
- pin_Read(pin)
- OW_Reset(pin)
- OW_Read(pin)
- OW_Read9(pin)
- OW_Write(pin, value)
- joystick(pin)
- bus_In()
- bus_Out(value)

2.7.1 pin_Set(mode, pin)

Syntax	pin_Set(mode, pin);																																																																																																																																																																																									
Arguments	mode, pin mode A value (usually a constant) specifying the pin operation pin A value (usually a constant) specifying the pin number The arguments can be a variable, array element, expression or constant.																																																																																																																																																																																									
Returns	nothing																																																																																																																																																																																									
Description	There are pre-defined constants for mode and pin : <table border="1"> <thead> <tr> <th rowspan="2">Pin name (predefined)</th> <th rowspan="2">PIXXI-28 Pin Number</th> <th colspan="4">Modes</th> </tr> <tr> <th>OUTPUT</th> <th>INPUT</th> <th>ANALOGUE</th> <th>SOUND</th> </tr> </thead> <tbody> <tr> <td>IO1_PIN</td> <td>1</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO2_PIN</td> <td>2</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO3_PIN</td> <td>4</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO4_PIN</td> <td>3</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO5_PIN</td> <td>11</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO6_PIN</td> <td>12</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO7_PIN</td> <td>28</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th rowspan="2">Pin name (predefined)</th> <th rowspan="2">PIXXI-44 Pin Number</th> <th colspan="4">Modes</th> </tr> <tr> <th>OUTPUT</th> <th>INPUT</th> <th>ANALOGUE</th> <th>SOUND</th> </tr> </thead> <tbody> <tr> <td>IO1_PIN</td> <td>25</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO2_PIN</td> <td>27</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO3_PIN</td> <td>23</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO4_PIN</td> <td>24</td> <td>✓</td> <td>✓</td> <td>✓</td> <td>✓</td> </tr> <tr> <td>IO5_PIN</td> <td>33</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO6_PIN</td> <td>37</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO7_PIN</td> <td>38</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO8_PIN</td> <td>19</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO9_PIN</td> <td>20</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO10_PIN</td> <td>41</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO11_PIN</td> <td>42</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO12_PIN</td> <td>1</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO13_PIN</td> <td>8</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO14_PIN</td> <td>9</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO15_PIN</td> <td>10</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO16_PIN</td> <td>11</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO17_PIN</td> <td>12</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO18_PIN</td> <td>44</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> <tr> <td>IO19_PIN</td> <td>13</td> <td>✓</td> <td>✓</td> <td>X</td> <td>✓</td> </tr> </tbody> </table> <table border="1"> <thead> <tr> <th>mode constants</th> <th>mode value</th> <th>meaning</th> </tr> </thead> <tbody> <tr> <td>OUTPUT</td> <td>0</td> <td>Pin is set to an output</td> </tr> <tr> <td>INPUT</td> <td>1</td> <td>Pin is set to an input</td> </tr> </tbody> </table>	Pin name (predefined)	PIXXI-28 Pin Number	Modes				OUTPUT	INPUT	ANALOGUE	SOUND	IO1_PIN	1	✓	✓	✓	✓	IO2_PIN	2	✓	✓	✓	✓	IO3_PIN	4	✓	✓	X	✓	IO4_PIN	3	✓	✓	X	✓	IO5_PIN	11	✓	✓	X	✓	IO6_PIN	12	✓	✓	X	✓	IO7_PIN	28	✓	✓	X	✓	Pin name (predefined)	PIXXI-44 Pin Number	Modes				OUTPUT	INPUT	ANALOGUE	SOUND	IO1_PIN	25	✓	✓	✓	✓	IO2_PIN	27	✓	✓	✓	✓	IO3_PIN	23	✓	✓	✓	✓	IO4_PIN	24	✓	✓	✓	✓	IO5_PIN	33	✓	✓	X	✓	IO6_PIN	37	✓	✓	X	✓	IO7_PIN	38	✓	✓	X	✓	IO8_PIN	19	✓	✓	X	✓	IO9_PIN	20	✓	✓	X	✓	IO10_PIN	41	✓	✓	X	✓	IO11_PIN	42	✓	✓	X	✓	IO12_PIN	1	✓	✓	X	✓	IO13_PIN	8	✓	✓	X	✓	IO14_PIN	9	✓	✓	X	✓	IO15_PIN	10	✓	✓	X	✓	IO16_PIN	11	✓	✓	X	✓	IO17_PIN	12	✓	✓	X	✓	IO18_PIN	44	✓	✓	X	✓	IO19_PIN	13	✓	✓	X	✓	mode constants	mode value	meaning	OUTPUT	0	Pin is set to an output	INPUT	1	Pin is set to an input

OUTPUT	0	Pin is set to an output																																																																																																																																																																																								
INPUT	1	Pin is set to an input																																																																																																																																																																																								

	ANALOGUE	2	Pin is set as analog input
	SOUND	3	Pin is set as sound output
Example	<pre>pin_Set(OUTPUT, IO2_PIN); // set IO2 to be used as an output pin_Set(INPUT, IO1_PIN); // set IO1 to be used as an input</pre>		

2.7.2 pin_HI(pin)

Syntax	<code>pin_HI(pin);</code>				
Arguments	pin <table border="1"><tr><td>pin</td><td>A value (usually a constant) specifying the pin number</td></tr><tr><td colspan="2">The arguments can be a variable, array element, expression or constant.</td></tr></table>	pin	A value (usually a constant) specifying the pin number	The arguments can be a variable, array element, expression or constant.	
pin	A value (usually a constant) specifying the pin number				
The arguments can be a variable, array element, expression or constant.					
Returns	nothing				
Description	Outputs a "High" level (logic 1) on the appropriate pin that was previously selected as an Output. If the pin is not already set to an output, it is automatically made an output.				
Example	<code>pin_HI(IO2_PIN); // output a Logic 1 on IO2 pin</code>				

2.7.3 pin_LO(pin)

Syntax	<code>pin_LO(pin);</code>				
Arguments	pin <table border="1"><tr><td>pin</td><td>A value (usually a constant) specifying the pin number</td></tr><tr><td colspan="2">The arguments can be a variable, array element, expression or constant.</td></tr></table>	pin	A value (usually a constant) specifying the pin number	The arguments can be a variable, array element, expression or constant.	
pin	A value (usually a constant) specifying the pin number				
The arguments can be a variable, array element, expression or constant.					
Returns	nothing				
Description	Outputs a "Low" level (logic 0) on the appropriate pin that was previously selected as an output. If the pin is not yet set as an output, it is automatically made to an output.				
Example	<code>pin_LO(IO1_PIN); // output a Logic 0 on IO1 pin</code>				

2.7.4 pin_Read(pin)

Syntax	pin_Read(pin);	
Arguments	pin	
	pin	A value (usually a constant) specifying the pin number The arguments can be a variable, array element, expression or constant.
Returns	value	Returns a Logic 1 (0x0001) or a Logic 0 (0x0000) Returns the 12-bit analogue value if the pin.is set as an analogue input
Description	Reads the logic state of the pin that was previously selected as an Input. Returns a "Low" (logic 0) or "High" (logic 1).	
Example	<pre>if(pin_Read(IO1_PIN) == 1) // read the value on IO1 calc_Threshold(); else ...</pre>	

2.7.5 OW_Reset(pin)

Syntax	OW_Reset(pin);																																																													
Arguments	pin																																																													
	pin	4D predefined Pin Name, see table below The arguments can be a variable, array element, expression or constant.																																																												
Returns	result																																																													
	result	Reset, and returns the status of the ONEWIRE device 0 = ACK 1 = No Activity (refer to Dallas 1wired documentation for further information)																																																												
Description	Resets an ONEWIRE device and returns the status.																																																													
	<table border="1"> <thead> <tr> <th>Pin Name (Predefined)</th> <th>PIXXI-28 Pin Number</th> <th>PIXXI-44 Pin Number</th> </tr> </thead> <tbody> <tr><td>IO1_PIN</td><td>1</td><td>25</td></tr> <tr><td>IO2_PIN</td><td>2</td><td>27</td></tr> <tr><td>IO3_PIN</td><td>4</td><td>23</td></tr> <tr><td>IO4_PIN</td><td>3</td><td>24</td></tr> <tr><td>IO5_PIN</td><td>11</td><td>33</td></tr> <tr><td>IO6_PIN</td><td>12</td><td>37</td></tr> <tr><td>IO7_PIN</td><td>28</td><td>38</td></tr> <tr><td>IO8_PIN</td><td>NA</td><td>19</td></tr> <tr><td>IO9_PIN</td><td>NA</td><td>20</td></tr> <tr><td>IO10_PIN</td><td>NA</td><td>41</td></tr> <tr><td>IO11_PIN</td><td>NA</td><td>42</td></tr> <tr><td>IO12_PIN</td><td>NA</td><td>1</td></tr> <tr><td>IO13_PIN</td><td>NA</td><td>8</td></tr> <tr><td>IO14_PIN</td><td>NA</td><td>9</td></tr> <tr><td>IO15_PIN</td><td>NA</td><td>10</td></tr> <tr><td>IO16_PIN</td><td>NA</td><td>11</td></tr> <tr><td>IO17_PIN</td><td>NA</td><td>12</td></tr> <tr><td>IO18_PIN</td><td>NA</td><td>44</td></tr> <tr><td>IO19_PIN</td><td>NA</td><td>13</td></tr> </tbody> </table>		Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number	IO1_PIN	1	25	IO2_PIN	2	27	IO3_PIN	4	23	IO4_PIN	3	24	IO5_PIN	11	33	IO6_PIN	12	37	IO7_PIN	28	38	IO8_PIN	NA	19	IO9_PIN	NA	20	IO10_PIN	NA	41	IO11_PIN	NA	42	IO12_PIN	NA	1	IO13_PIN	NA	8	IO14_PIN	NA	9	IO15_PIN	NA	10	IO16_PIN	NA	11	IO17_PIN	NA	12	IO18_PIN	NA	44	IO19_PIN	NA	13
Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number																																																												
IO1_PIN	1	25																																																												
IO2_PIN	2	27																																																												
IO3_PIN	4	23																																																												
IO4_PIN	3	24																																																												
IO5_PIN	11	33																																																												
IO6_PIN	12	37

IO16_PIN	NA	11																																																												
IO17_PIN	NA	12																																																												
IO18_PIN	NA	44																																																												
IO19_PIN	NA	13																																																												
Example	<pre>print ("result=", OW_Reset(IO1_PIN));</pre> <p>This example will print a 0 if the device initialised successfully.</p>																																																													

2.7.6 OW_Read(pin)

Syntax	OW_Read(pin);																																																													
Arguments	pin																																																													
	pin	4D predefined Pin Name, see table below																																																												
	The arguments can be a variable, array element, expression or constant.																																																													
Returns	value																																																													
	value	A word holding the lower 8 bits contain data bits received from the 1-Wire device.																																																												
Description	<p>Reads the 8 bit value from a 1-Wire devices register. (refer to Dallas 1-Wire documentation for further information)</p> <table border="1"> <thead> <tr> <th>Pin Name (Predefined)</th> <th>PIXXI-28 Pin Number</th> <th>PIXXI-44 Pin Number</th> </tr> </thead> <tbody> <tr><td>IO1_PIN</td><td>1</td><td>25</td></tr> <tr><td>IO2_PIN</td><td>2</td><td>27</td></tr> <tr><td>IO3_PIN</td><td>4</td><td>23</td></tr> <tr><td>IO4_PIN</td><td>3</td><td>24</td></tr> <tr><td>IO5_PIN</td><td>11</td><td>33</td></tr> <tr><td>IO6_PIN</td><td>12</td><td>37</td></tr> <tr><td>IO7_PIN</td><td>28</td><td>38</td></tr> <tr><td>IO8_PIN</td><td>NA</td><td>19</td></tr> <tr><td>IO9_PIN</td><td>NA</td><td>20</td></tr> <tr><td>IO10_PIN</td><td>NA</td><td>41</td></tr> <tr><td>IO11_PIN</td><td>NA</td><td>42</td></tr> <tr><td>IO12_PIN</td><td>NA</td><td>1</td></tr> <tr><td>IO13_PIN</td><td>NA</td><td>8</td></tr> <tr><td>IO14_PIN</td><td>NA</td><td>9</td></tr> <tr><td>IO15_PIN</td><td>NA</td><td>10</td></tr> <tr><td>IO16_PIN</td><td>NA</td><td>11</td></tr> <tr><td>IO17_PIN</td><td>NA</td><td>12</td></tr> <tr><td>IO18_PIN</td><td>NA</td><td>44</td></tr> <tr><td>IO19_PIN</td><td>NA</td><td>13</td></tr> </tbody> </table>		Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number	IO1_PIN	1	25	IO2_PIN	2	27	IO3_PIN	4	23	IO4_PIN	3	24	IO5_PIN	11	33	IO6_PIN	12	37	IO7_PIN	28	38	IO8_PIN	NA	19	IO9_PIN	NA	20	IO10_PIN	NA	41	IO11_PIN	NA	42	IO12_PIN	NA	1	IO13_PIN	NA	8	IO14_PIN	NA	9	IO15_PIN	NA	10	IO16_PIN	NA	11	IO17_PIN	NA	12	IO18_PIN	NA	44	IO19_PIN	NA	13
Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number

IO14_PIN	NA	9																																																												
IO15_PIN	NA	10																																																												
IO16_PIN	NA	11																																																												
IO17_PIN	NA	12																																																												
IO18_PIN	NA	44																																																												
IO19_PIN	NA	13																																																												
Example	<pre>// read temperature from DS1821 device var temp_buf; OW_Reset(IO1_PIN); // reset the device OW_Write(IO1_PIN,0xAA); // send the read command temp_buf := OW_Read(IO1_PIN); // read the device register</pre>																																																													

2.7.7 OW_Read9(pin)

Syntax	OW_Read9(pin);																																																													
Arguments	pin																																																													
	pin	4D predefined Pin Name, see table below																																																												
	The arguments can be a variable, array element, expression or constant.																																																													
Returns	value																																																													
	value	A word holding 9 or more data bits received from the 1-Wire device.																																																												
Description	Reads the 9 or more bit value from a 1-Wire devices register. (refer to Dallas 1wired documentation for further information)																																																													
	<table border="1"> <thead> <tr> <th>Pin Name (Predefined)</th> <th>PIXXI-28 Pin Number</th> <th>PIXXI-44 Pin Number</th> </tr> </thead> <tbody> <tr><td>IO1_PIN</td><td>1</td><td>25</td></tr> <tr><td>IO2_PIN</td><td>2</td><td>27</td></tr> <tr><td>IO3_PIN</td><td>4</td><td>23</td></tr> <tr><td>IO4_PIN</td><td>3</td><td>24</td></tr> <tr><td>IO5_PIN</td><td>11</td><td>33</td></tr> <tr><td>IO6_PIN</td><td>12</td><td>37</td></tr> <tr><td>IO7_PIN</td><td>28</td><td>38</td></tr> <tr><td>IO8_PIN</td><td>NA</td><td>19</td></tr> <tr><td>IO9_PIN</td><td>NA</td><td>20</td></tr> <tr><td>IO10_PIN</td><td>NA</td><td>41</td></tr> <tr><td>IO11_PIN</td><td>NA</td><td>42</td></tr> <tr><td>IO12_PIN</td><td>NA</td><td>1</td></tr> <tr><td>IO13_PIN</td><td>NA</td><td>8</td></tr> <tr><td>IO14_PIN</td><td>NA</td><td>9</td></tr> <tr><td>IO15_PIN</td><td>NA</td><td>10</td></tr> <tr><td>IO16_PIN</td><td>NA</td><td>11</td></tr> <tr><td>IO17_PIN</td><td>NA</td><td>12</td></tr> <tr><td>IO18_PIN</td><td>NA</td><td>44</td></tr> <tr><td>IO19_PIN</td><td>NA</td><td>13</td></tr> </tbody> </table>		Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number	IO1_PIN	1	25	IO2_PIN	2	27	IO3_PIN	4	23	IO4_PIN	3	24	IO5_PIN	11	33	IO6_PIN	12	37	IO7_PIN	28	38	IO8_PIN	NA	19	IO9_PIN	NA	20	IO10_PIN	NA	41	IO11_PIN	NA	42	IO12_PIN	NA	1	IO13_PIN	NA	8	IO14_PIN	NA	9	IO15_PIN	NA	10	IO16_PIN	NA	11	IO17_PIN	NA	12	IO18_PIN	NA	44	IO19_PIN	NA	13
Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number

IO19_PIN	NA	13																																																												
Example	<pre>// read temperature from DS1821 device var temp_buf; OW_Reset(IO1_PIN); // reset the device OW_Write(IO1_PIN, 0xAA); // send the read command temp_buf := OW_Read9(IO1_PIN); // read the device register</pre>																																																													

2.7.8 OW_Write(pin, value)

Syntax	<code>OW_Write(pin, data);</code>																																																												
Arguments	pin 4D predefined Pin Name, see table below. value The lower 8 bits of data are sent to the 1-Wire device. The argument can be a variable, array element, expression or constant.																																																												
Returns	nothing																																																												
Description	Writes the 8 bit data to 1-Wire devices register. (refer to Dallas 1wired documentation for further information)																																																												
	<table border="1"> <thead> <tr> <th>Pin Name (Predefined)</th> <th>PIXXI-28 Pin Number</th> <th>PIXXI-44 Pin Number</th> </tr> </thead> <tbody> <tr><td>IO1_PIN</td><td>1</td><td>25</td></tr> <tr><td>IO2_PIN</td><td>2</td><td>27</td></tr> <tr><td>IO3_PIN</td><td>4</td><td>23</td></tr> <tr><td>IO4_PIN</td><td>3</td><td>24</td></tr> <tr><td>IO5_PIN</td><td>11</td><td>33</td></tr> <tr><td>IO6_PIN</td><td>12</td><td>37</td></tr> <tr><td>IO7_PIN</td><td>28</td><td>38</td></tr> <tr><td>IO8_PIN</td><td>NA</td><td>19</td></tr> <tr><td>IO9_PIN</td><td>NA</td><td>20</td></tr> <tr><td>IO10_PIN</td><td>NA</td><td>41</td></tr> <tr><td>IO11_PIN</td><td>NA</td><td>42</td></tr> <tr><td>IO12_PIN</td><td>NA</td><td>1</td></tr> <tr><td>IO13_PIN</td><td>NA</td><td>8</td></tr> <tr><td>IO14_PIN</td><td>NA</td><td>9</td></tr> <tr><td>IO15_PIN</td><td>NA</td><td>10</td></tr> <tr><td>IO16_PIN</td><td>NA</td><td>11</td></tr> <tr><td>IO17_PIN</td><td>NA</td><td>12</td></tr> <tr><td>IO18_PIN</td><td>NA</td><td>44</td></tr> <tr><td>IO19_PIN</td><td>NA</td><td>13</td></tr> </tbody> </table>	Pin Name (Predefined)	PIXXI-28 Pin Number	PIXXI-44 Pin Number	IO1_PIN	1	25	IO2_PIN	2	27	IO3_PIN	4	23	IO4_PIN	3	24	IO5_PIN	11	33	IO6_PIN	12	37	IO7_PIN	28	38	IO8_PIN	NA	19	IO9_PIN	NA	20	IO10_PIN	NA	41	IO11_PIN	NA	42	IO12_PIN	NA	1	IO13_PIN	NA	8	IO14_PIN	NA	9	IO15_PIN	NA	10	IO16_PIN	NA	11	IO17_PIN	NA	12	IO18_PIN	NA	44	IO19_PIN	NA	13

IO19_PIN	NA	13																																																											
Example	<pre>//===== // For this demo to work, a Dallas DS18B20 must be connected to // IO1 AND POWERED FROM 3.3 to 5V. // DS18B20 pin1 = Gnd / pin2 = data in/out / pin 3 = +3.3v // Refer to the Dallas DS18B20 for further information //===== func main() var temp_buf ; pause(1000); txt_MoveCursor(0,0); if(OW_Reset(IO1_PIN)) // initialise and test print("No device detected"); while(1); endif repeat txt_MoveCursor(0, 0); print ("result=", OW_Reset(IO1_PIN)); </pre>																																																												

```
    OW_Write(IO1_PIN, 0xcc);           // skip ROM
    OW_Write(IO1_PIN, 0x44);           // start conversion
    OW_Reset(IO1_PIN);                // reset
    OW_Write(IO1_PIN, 0xcc);           // skip ROM
    OW_Write(IO1_PIN, 0xBE);           // get temperature
    temp_buf := OW_Read(IO1_PIN);
    temp_buf += (OW_Read(IO1_PIN) << 8);

    txt_MoveCursor(1, 0);
    print ("temp_buf=0x", [HEX4] temp_buf);
    forever
endfunc
```

2.7.9 joystick(pin)

Syntax	joystick();																	
Arguments	none																	
Returns	value																	
	value	Returns the joystick value.																
Description	Returns the value of the joystick position (5 position switch implementation). The joystick values are: <table border="1" style="margin-top: 10px;"> <thead> <tr> <th>Value</th> <th>Status</th> </tr> </thead> <tbody> <tr><td>0</td><td>JOY_RELEASED</td></tr> <tr><td>1</td><td>JOY_UP</td></tr> <tr><td>2</td><td>JOY_LEFT</td></tr> <tr><td>3</td><td>JOY_DOWN</td></tr> <tr><td>4</td><td>JOY_RIGHT</td></tr> <tr><td>5</td><td>JOY_BTNB</td></tr> <tr><td>6</td><td>JOY_BTNA</td></tr> </tbody> </table> <p>Note: The joystick input uses the specified pin utilizing the A/D converter. Each switch is connected to a junction of 2 resistors that form a unique voltage divider circuit. The joystick can also be implemented using multiple buttons and resistors. Refer to the hardware layer section of the PIXXI-28 and PIXXI-44 processor data sheets for the required resistor values.</p>		Value	Status	0	JOY_RELEASED	1	JOY_UP	2	JOY_LEFT	3	JOY_DOWN	4	JOY_RIGHT	5	JOY_BTNB	6	JOY_BTNA
Value	Status																	
0	JOY_RELEASED																	
1	JOY_UP																	
2	JOY_LEFT																	
3	JOY_DOWN																	
4	JOY_RIGHT																	
5	JOY_BTNB																	
6	JOY_BTNA																	
Example	<pre> joy := joystick(IO1_PIN); // read the joystick on IO1 if (joy == JOY_RELEASED) putstr(" "); if (joy == JOY_UP) putstr(" UP"); if (joy == JOY_LEFT) putstr("LEFT"); if (joy == JOY_DOWN) putstr("DOWN"); if (joy == JOY_RIGHT) putstr("RIGHT"); if (joy == JOY_BTNB) putstr("BUTTON B"); if (joy == JOY_BTNA) putstr("BUTTON A"); </pre>																	

2.7.10 bus_In()

Syntax	bus_In();																																		
Arguments	none																																		
Returns	value																																		
	value	Returns the 7-bit value of the bus.																																	
Description	<p>Read the 7-bit port regardless of pin configurations. If a pin is configured as input, the pin is read directly as if it were a digital input. If a pin is configured as an output, the pin is also read directly, giving the output latch state.</p> <p>This is only available in Mode 2 (4-wire SPI Mode) of Pixxi-44</p>																																		
<table border="1"><thead><tr><th>4D Pin Name (Predefined)</th><th>BUS Bit Number</th><th>PIXXI-44 Pin Number</th><th>Availability</th></tr></thead><tbody><tr><td>IO12_PIN</td><td>0</td><td>1</td><td>Yes</td></tr><tr><td>IO13_PIN</td><td>1</td><td>8</td><td>Yes</td></tr><tr><td>IO14_PIN</td><td>2</td><td>9</td><td>Yes</td></tr><tr><td>IO15_PIN</td><td>3</td><td>10</td><td>Yes</td></tr><tr><td>IO16_PIN</td><td>4</td><td>11</td><td>Yes</td></tr><tr><td>IO17_PIN</td><td>5</td><td>12</td><td>Yes</td></tr><tr><td>IO18_PIN</td><td>6</td><td>44</td><td>Yes</td></tr></tbody></table>				4D Pin Name (Predefined)	BUS Bit Number	PIXXI-44 Pin Number	Availability	IO12_PIN	0	1	Yes	IO13_PIN	1	8	Yes	IO14_PIN	2	9	Yes	IO15_PIN	3	10	Yes	IO16_PIN	4	11	Yes	IO17_PIN	5	12	Yes	IO18_PIN	6	44	Yes
4D Pin Name (Predefined)	BUS Bit Number	PIXXI-44 Pin Number	Availability																																
IO12_PIN	0	1	Yes																																
IO13_PIN	1	8	Yes																																
IO14_PIN	2	9	Yes																																
IO15_PIN	3	10	Yes																																
IO16_PIN	4	11	Yes																																
IO17_PIN	5	12	Yes																																
IO18_PIN	6	44	Yes																																
Example	<pre>var1 := bus_In(); //Read the 7-bit value off the IO12-IO18 pins</pre>																																		

2.7.11 bus_Out(value)

Syntax	bus_Out(value);																																		
Arguments	value																																		
	value	A value (usually a constant) specifying the pin number. Bit 0 corresponds to IO12 through to bit6 which corresponds to IO18. This is a 7-bit BUS.																																	
	The arguments can be a variable, array element, expression or constant.																																		
Returns	Nothing																																		
Description	<p>The lower 7 bits of the argument are placed on the 7bit wide bus. Any BUS pins that are set to inputs are not affected.</p> <p>This is only available in Mode 2 (4-wire SPI Mode) of Pixxi-44</p>																																		
	<table border="1"><thead><tr><th>4D Pin Name (Predefined)</th><th>BUS Bit Number</th><th>PIXXI-44 Pin Number</th><th>Availability</th></tr></thead><tbody><tr><td>IO12_PIN</td><td>0</td><td>1</td><td>Yes</td></tr><tr><td>IO13_PIN</td><td>1</td><td>8</td><td>Yes</td></tr><tr><td>IO14_PIN</td><td>2</td><td>9</td><td>Yes</td></tr><tr><td>IO15_PIN</td><td>3</td><td>10</td><td>Yes</td></tr><tr><td>IO16_PIN</td><td>4</td><td>11</td><td>Yes</td></tr><tr><td>IO17_PIN</td><td>5</td><td>12</td><td>Yes</td></tr><tr><td>IO18_PIN</td><td>6</td><td>44</td><td>Yes</td></tr></tbody></table>			4D Pin Name (Predefined)	BUS Bit Number	PIXXI-44 Pin Number	Availability	IO12_PIN	0	1	Yes	IO13_PIN	1	8	Yes	IO14_PIN	2	9	Yes	IO15_PIN	3	10	Yes	IO16_PIN	4	11	Yes	IO17_PIN	5	12	Yes	IO18_PIN	6	44	Yes
4D Pin Name (Predefined)	BUS Bit Number	PIXXI-44 Pin Number	Availability																																
IO12_PIN	0	1	Yes																																
IO13_PIN	1	8	Yes																																
IO14_PIN	2	9	Yes																																
IO15_PIN	3	10	Yes																																
IO16_PIN	4	11	Yes																																
IO17_PIN	5	12	Yes																																
IO18_PIN	6	44	Yes																																
Example	<pre>var arg1; arg1 := 0b0011010; // set desired mask bus_Out(arg1); // set IO13, IO15 and IO16 to output, making them HI</pre>																																		

2.8. Graphics Functions

Summary of functions in this section:

- `gfx_Cls()`
- `gfx_ChangeColour(oldColour, newColour)`
- `gfx_Circle(x, y, radius, colour)`
- `gfx_CircleFilled(x, y, radius, colour)`
- `gfx_Line(x1, y1, x2, y2, colour)`
- `gfx_Hline(y, x1, x2, colour)`
- `gfx_Vline(x, y1, y2, colour)`
- `gfx_Rectangle(x1, y1, x2, y2, colour)`
- `gfx_RectangleFilled(x1, y1, x2, y2, colour)`
- `gfx_RoundRect(x1, y1, x2, y2, rad, colour)`
- `gfx_Polyline(n, vx, vy, colour)`
- `gfx_Polygon(n, vx, vy, colour)`
- `gfx_Triangle(x1, y1, x2, y2, x3, y3, colour)`
- `gfx_Dot()`
- `gfx_Bullet(radius)`
- `gfx_OrbitInit(&x_dest, &y_dest)`
- `gfx_Orbit(angle, distance)`
- `gfx_PutPixel(x, y, colour)`
- `gfx_GetPixel(x, y)`
- `gfx_MoveTo(xpos, ypos)`
- `gfx_MoveRel(xoffset, yoffset)`
- `gfx_IncX()`
- `gfx_IncY()`
- `gfx_LineTo(xpos, ypos)`
- `gfx_LineRel(xpos, ypos)`
- `gfx_BoxTo(x2, y2)`
- `gfx_Ellipse(x, y, xrad, yrad, colour)`
- `gfx_EllipseFilled(x, y, xrad, yrad, colour)`
- `gfx_ScreenCopyPaste(xs, ys, xd, yd, width, height)`
- `gfx_RGBto565(RED, GREEN, BLUE)`
- `gfx_332to565(COLOUR)`
- `gfx_TriangleFilled(x1, y1, x2, y2, x3, y3, colour)`
- `gfx_PolygonFilled(n, vx, vy, colour)`
- `gfx_Origin(x, y)`
- `gfx_SetClipRegion()`
- `gfx_ClipWindow(x1, y1, x2, y2)`
- `gfx_Get(mode)`
- `gfx_Set(function, value)`
- `gfx_Set shortcuts:`
 - `gfx_PenSize(mode)`
 - `gfx_BGcolour(colour)`
 - `gfx_ObjectColour(colour)`
 - `gfx_Clipping(mode)`
 - `gfx_TransparentColour(colour)`
 - `gfx_Transparency(mode)`
 - `gfx_FrameDelay(delay)`
 - `gfx_ScreenMode(delay)`
 - `gfx_OutlineColour(colour)`
 - `gfx_Contrast(value)`
 - `gfx_LinePattern(pattern)`

- gfx_ColourMode(mode)
- gfx_BevelWidth(mode)
- gfx_BevelShadow(value)
- gfx_Xorigin(offset)
- gfx_Yorigin(offset)
- gfx_RingSegment(x, y, Rad1, Rad2, starta, enda, colour)
- gfx_ReadGRAMarea(x1, y1, x2, y2, ptr)
- gfx_WriteGRAMarea(x1, y1, x2, y2, ptr)
- gfx_Surround(x1, y1, x2, y2, rad1, rad2, colour)
- gfx_Gradient(style, x1, y1, x2, y2, color1, color2)
- gfx_RoundGradient(style, x1, y1, x2, y2, radius, color1, color2)
- gfx_XYrotToVal(x, y, base, mina, maxa, minv, maxv)
- gfx_XYlinToVal(x, y, base, minpos, maxpos, minv, maxv)
- gfx_SpriteSet(bitmap, colours, palette)
- gfx_BlitSprite(spritenumber, palette, xpos, ypos, orientation, preimage)
- gfx_Button(state, x, y, buttonColour, txtColour, font, txtWidth txtHeight, text)
- gfx_Button4(state, &gfx_ButtonRam, &gfx_ButtonDef)
- gfx_Switch(state, &SwitchRam, &SwitchDef)
- gfx_Slider(mode, x1, y1, x2, y2, colour, scale, value)
- gfx_Slider5(value, &SliderRam, &SliderDef)
- gfx_Dial(value, &DialRam, &DialDef)
- gfx_AngularMeter(value, &MeterRam, &MeterDef)
- gfx_Needle(value, &NeedleRam, &NeedleDef)
- gfx_Gauge(value, &GaugeRam, &GaugeDef)
- gfx_RulerGauge(value, &RulerGaugeRam, &RulerGaugeDef)
- gfx_Led(state, &LedRam, &LedDef)
- gfx_LedDigits(value, &LedDigitRam, &LedDigitDef)
- gfx_LedDigit(x, y, digitsize, oncolour, offcolour, value)
- gfx_Scale(&ScaleRam, &ScaleDef)
- gfx_Panel(state, x, y, Width, Height, Colour)
- gfx_Panel2(state, x, y, width, height, w1, w2, cl, cr)

2.8.1 gfx_Cls()

Syntax	<code>gfx_Cls();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	<p>Clear the screen using the current background colour. <code>gfx_Cls()</code> command brings some of the settings back to default; such as,</p> <ul style="list-style-type: none">• Transparency turned OFF• Outline colour set to BLACK• Opacity set to OPAQUE• Pen set to OUTLINE• Line patterns set to OFF• Right text margin set to full width• Text magnifications set to 1• All origins set to 0:0 <p>The alternative to maintain settings and to clear screen is to draw a filled rectangle with the required background colour.</p>
Example	<pre>gfx_BGcolour(DARKGRAY); gfx_Cls();</pre> <p>This example clears the entire display using colour DARKGRAY</p>

2.8.2 gfx_ChangeColour(oldColour, newColour)

Syntax	gfx_ChangeColour(oldColour , newColour);
Arguments	oldColour, newColour
	oldColour Specifies the sample colour to be changed within the clipping window.
	newColour Specifies the new colour to change all occurrences of old colour within the clipping window.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Changes all oldColour pixels to newColour within the clipping area.
Example	<pre>func main() txt_Width(3); txt_Height(5); gfx_MoveTo(8,20); print("TEST"); // print the string gfx_SetClipRegion(); // force clipping area to extents of text // just printed. gfx_ChangeColour(BLACK, RED); // test change of background colour repeat forever endfunc</pre> <p>This example prints a test string, forces the clipping area to the extent of the text that was printed, then changes the background colour.</p>

2.8.3 gfx_Circle(x, y, radius, colour)

Syntax	<code>gfx_Circle(x, y, rad, colour);</code>
Arguments	x, y, rad, colour
	x, y Specifies the center of the circle.
	rad Specifies the radius of the circle.
	colour Specifies the colour of the circle.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a circle with centre point x1, y1 with radius r using the specified colour. NB: The default PEN_SIZE is set to OUTLINE , however, if PEN_SIZE is set to SOLID , the circle will be drawn filled, if PEN_SIZE is set to OUTLINE , the circle will be drawn as an outline. If the circle is drawn as SOLID , the outline colour can be specified with gfx_OutlineColour(...) . If OUTLINE_COLOUR is set to 0, no outline is drawn.
Example	<code>gfx_Circle(50,50,30, RED); // assuming PEN_SIZE is OUTLINE</code> This example draws a BLUE circle outline centred at x=50, y=50 with a radius of 30 pixel units.

2.8.4 gfx_CircleFilled(x, y, radius, colour)

Syntax	<code>gfx_CircleFilled(x, y, rad, colour);</code>
Arguments	x, y, rad, colour x, y Specifies the center of the circle. rad Specifies the radius of the circle. colour Specifies the fill colour of the circle. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a SOLID circle with centre point x1, y1 with radius using the specified colour. The outline colour can be specified with <code>gfx_OutlineColour(...)</code> . If OUTLINE_COLOUR is set to 0, no outline is drawn. Note: The PEN_SIZE is ignored, the circle is always drawn SOLID .
Example	<code>gfx_CircleFilled(50, 50, 10, RED); // Draw a solid red circle</code> This example draws a RED solid circle centred at x=50, y=50 with a radius of 10 pixel units.

2.8.5 gfx_Line(x1, y1, x2, y2, colour)

Syntax	<code>gfx_Line(x1, y1, x2, y2, colour);</code>	
Arguments	x1, y1, x2, y2, colour	
	x1, y1	Specifies the starting coordinates of the line.
	x2, y2	Specifies the ending coordinates of the line.
	colour	Specifies the colour of the line.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Draws a line from x1, y1 to x2, y2 using the specified colour. The line is drawn using the current object colour. The current origin is not altered. The line may be tessellated with the <code>gfx_LinePattern(...)</code> function.	
Example	<code>gfx_Line(100, 100, 10, 10, RED);</code> This example draws a RED line from x1=10, y1=10 to x2=100, y2=100	

2.8.6 gfx_Hline(y, x1, x2, colour)

Syntax	<code>gfx_Hline(y, x1, x2, colour);</code>
Arguments	y, x1, x2, colour
	y Specifies the vertical position of the horizontal line.
	x1, x2 Specifies the horizontal end points of the line.
	colour Specifies the colour of the horizontal line.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a fast horizontal line from x1 to x2 at vertical coordinate y using colour.
Example	<code>gfx_Hline(50, 10, 80, RED);</code> This example draws a RED horizontal line at y=50, from x1=10 to x2=80

2.8.7 gfx_Vline(x, y1, y2, colour)

Syntax	<code>gfx_Vline(x, y1, y2, colour);</code>
Arguments	x, y1, y2, colour
	x Specifies the horizontal position of the vertical line.
	y1, y2 Specifies the vertical end points of the line.
	colour Specifies the colour of the vertical line.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a fast vertical line from y1 to y2 at horizontal coordinate x using colour.
Example	<code>gfx_Vline(20, 30, 70, RED);</code> This example draws a RED vertical line at x=20, from y1=30 to y2=70

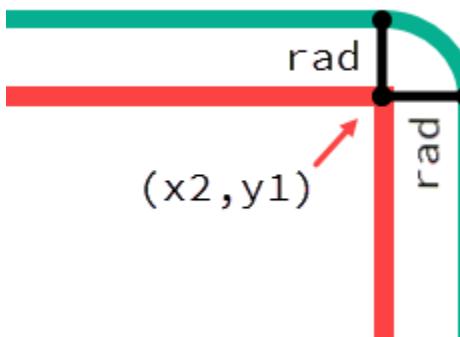

2.8.8 gfx_Rectangle(x1, y1, x2, y2, colour)

Syntax	<code>gfx_Rectangle(x1, y1, x2, y2, colour);</code>
Arguments	x1, y1, x2, y2, colour x1, y1 Specifies the top left corner of the rectangle. x2, y2 Specifies the bottom right corner of the rectangle. colour Specifies the colour of the rectangle. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a rectangle from x1, y1 to x2, y2 using the specified colour. The line may be tessellated with the <code>gfx_LinePattern(...)</code> function. Note: The default PEN_SIZE is set to OUTLINE , however, if PEN_SIZE is set to SOLID , the rectangle will be drawn filled, if PEN_SIZE is set to OUTLINE , the rectangle will be drawn as an outline. If the rectangle is drawn as SOLID , the outline colour can be specified with <code>gfx_OutlineColour(...)</code> . If OUTLINE_COLOUR is set to 0, no outline is drawn. The outline may be tessellated with the <code>gfx_LinePattern(...)</code> function.
Example	<code>gfx_Rectangle(10, 10, 30, 30, GREEN);</code> This example draws a GREEN rectangle from x1=10, y1=10 to x2=30, y2=30

2.8.9 gfx_RectangleFilled(x1, y1, x2, y2, colour)

Syntax	<code>gfx_RectangleFilled(x1, y1, x2, y2, colour);</code>
Arguments	x1, y1, x2, y2, colour
	x1, y1 Specifies the top left corner of the rectangle.
	x2, y2 Specifies the bottom right corner of the rectangle.
	colour Specifies the colour of the rectangle.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a SOLID rectangle from x1, y1 to x2, y2 using the specified colour. The line may be tessellated with the <code>gfx_LinePattern(...)</code> function. Note: The outline colour can be specified with <code>gfx_OutlineColour(...)</code> . If OUTLINE_COLOUR is set to 0, no outline is drawn. The outline may be tessellated with the <code>gfx_LinePattern(...)</code> function. The PEN_SIZE is ignored, the rectangle is always drawn SOLID .
Example	<code>gfx_RectangleFilled(30,30,80,80, RED);</code> This example draws a filled RED rectangle from x1=30, y1=30 to x2=80, y2=80

2.8.10 gfx_RoundRect(x1, y1, x2, y2, rad, colour)

Syntax	<code>gfx_RoundRect(x1, y1, x2, y2, rad, colour);</code>
Arguments	x1, y1, x2, y2, rad, colour x1, y1 Specifies the top left corner of the inner rectangle. x2, y2 Specifies the bottom right corner of the inner rectangle. rad Specifies the corner radius. This is the distance in pixels extending from the corners of the inner rectangle. colour Specifies the colour of the rectangle. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draw a filled rectangle at the given co-ordinates with optional rounded corners. If $x1 = x2$ or $y1 = y2$ no straight line part is drawn.  <p>The diagram shows a rounded rectangle. A red horizontal line segment starts at point (x_1, y_1) and ends at point (x_2, y_1). A green vertical line segment starts at (x_2, y_1) and ends at (x_2, y_2). The top-left corner of the rectangle is highlighted in red and labeled (x_2, y_1). The corner radius is labeled rad and is indicated by a black line segment from the corner to the midpoint of the top and left edges. The rest of the rectangle's edges are shown in green.</p> <p>The actual width of the round-corners rectangle is computed by: 2*rad + x2 - x1. The actual height of the round-corners rectangle is computed by: 2*rad + y2 - y1.</p>
Example	<code>gfx_RoundRect(30, 30, 80, 80, 5, RED);</code>

2.8.11 gfx_Polyline(n, vx, vy, colour)

Syntax	<code>gfx_Polyline(n, vx, vy, colour);</code>
Arguments	n , vx , vy , colour n Specifies the number of elements in the x and y arrays specifying the vertices for the polyline. vx Specifies the addresses of the storage of the array of elements for the x coordinates of the vertices. vy Specifies the addresses of the storage of the array of elements for the y coordinates of the vertices. colour Specifies the colour for the lines The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Plots lines between points specified by a pair of arrays using the specified colour. The lines may be tessellated with the <code>gfx_LinePattern(...)</code> function. <code>gfx_Polyline</code> can be used to create complex raster graphics by loading the arrays from serial input or from MEDIA with very little code requirement.
Example	<pre>#inherit "4DGL_16bitColours.fnc" var vx[20], vy[20]; func main() vx[0] := 36; vy[0] := 110; vx[1] := 36; vy[1] := 80; vx[2] := 50; vy[2] := 80; vx[3] := 50; vy[3] := 110; vx[4] := 76; vy[4] := 104; vx[5] := 85; vy[5] := 80; vx[6] := 94; vy[6] := 104; vx[7] := 76; vy[7] := 70; vx[8] := 85; vy[8] := 76; vx[9] := 94; vy[9] := 70; vx[10] := 110; vy[10] := 66; vx[11] := 110; vy[11] := 80; vx[12] := 100; vy[12] := 90; vx[13] := 120; vy[13] := 90; vx[14] := 110; vy[14] := 80; vx[15] := 101; vy[15] := 70; vx[16] := 110; vy[16] := 76; vx[17] := 119; vy[17] := 70; // house gfx_Rectangle(6,50,66,110,RED); // frame gfx_Triangle(6,50,36,9,66,50,YELLOW); // roof gfx_Polyline(4, vx, vy, CYAN); // door // man gfx_Circle(85, 56, 10, BLUE); // head gfx_Line(85, 66, 85, 80, BLUE); // body gfx_Polyline(3, vx+4, vy+4, CYAN); // legs gfx_Polyline(3, vx+7, vy+7, BLUE); // arms </pre>

```
// woman
gfx_Circle(110, 56, 10, PINK);           // head
gfx_Polyline(5, vx+10, vy+10, BROWN);    // dress
gfx_Line(104, 104, 106, 90, PINK);        // left arm
gfx_Line(112, 90, 116, 104, PINK);        // right arm
gfx_Polyline(3, vx+15, vy+15, SALMON);   // dress

repeat forever

endfunc
```

2.8.12 gfx_Polygon(n, vx, vy, colour)

Syntax	<code>gfx_Polygon(n, vx, vy, colour);</code>
Arguments	n, vx, vy, colour n Specifies the number of elements in the x and y arrays specifying the vertices for the polygon. vx Specifies the addresses of the storage of the array of elements for the x coordinates of the vertices. vy Specifies the addresses of the storage of the array of elements for the y coordinates of the vertices. colour Specifies the colour for the polygon The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Plots lines between points specified by a pair of arrays using the specified colour. The last point is drawn back to the first point, completing the polygon. The lines may be tessellated with the <code>gfx_LinePattern(...)</code> function. <code>gfx_Polygon</code> can be used to create complex raster graphics by loading the arrays from serial input or from MEDIA with very little code requirement.
Example	<pre>var vx[7], vy[7]; func main() vx[0] := 10; vy[0] := 10; vx[1] := 35; vy[1] := 5; vx[2] := 80; vy[2] := 10; vx[3] := 60; vy[3] := 25; vx[4] := 80; vy[4] := 40; vx[5] := 35; vy[5] := 50; vx[6] := 10; vy[6] := 40; gfx_Polygon(7, vx, vy, RED); repeat forever endfunc</pre>

2.8.13 gfx_Triangle(x1, y1, x2, y2, x3, y3, colour)

Syntax	<code>gfx_Triangle(x1, y1, x2, y2, x3, y3, colour);</code>
Arguments	x1, y1, x2, y2, x3, y3, colour
	x1, y1 Specifies the first vertices of the triangle.
	x2, y2 Specifies the second vertices of the triangle.
	x3, y3 Specifies the third vertices of the triangle.
	colour Specifies the colour for the triangle.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a triangle outline between vertices <code>x1,y1 , x2,y2</code> and <code>x3,y3</code> using the specified colour. The line may be tessellated with the <code>gfx_LinePattern(...)</code> function.
Example	<code>gfx_Triangle(10,10,30,10,20,30,CYAN);</code> This example draws a CYAN triangular outline with vertices at 10,10 30,10 20,30

2.8.14 gfx_Dot()

Syntax	<code>gfx_Dot();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Draws a pixel at at the current origin using the current object colour.
Example	<pre>gfx_MoveTo(40, 50); gfx_ObjectColour(RED); gfx_Dot();</pre>
	This example draws a RED pixel at x=40, y=50

2.8.15 gfx_Bullet(radius)

Syntax	<code>gfx_Bullet(radius);</code>	
Arguments	radius	
	radius	Specifies the radius of the bullet. The arguments can be a variable, array element, expression or constant
Returns	nothing	
Description	Draws a circle or 'bullet point' with radius <i>r</i> at at the current origin using the current object colour. Note: The default PEN_SIZE is set to OUTLINE , however, if PEN_SIZE is set to SOLID , the circle will be drawn filled, if PEN_SIZE is set to OUTLINE , the circle will be drawn as an outline. If the circle is drawn as SOLID , the outline colour can be specified with gfx_OutlineColour(...) .	
Example	<pre>gfx_MoveTo(30, 30); gfx_Bullet(10); // Draw a 10pixel radius Bullet at x=30, y=30.</pre>	

2.8.16 gfx_OrbitInit(&x_dest, &y_dest)

Syntax	<code>gfx_OrbitInit(&x_dest, &y_dest);</code>	
Arguments	x_dest, y_dest	
	x_dest, y_dest	Specifies the addresses of the storage locations for the orbit calculation.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Sets up the internal pointers for the gfx_Orbit(..) result variables. The &x_orb and &y_orb parameters are the addresses of the variables or array elements that are used to store the result from the gfx_Orbit(..) function.	
Example	<pre>var targetX, targetY; gfx_OrbitInit(&targetX, &targetY);</pre>	
	This example sets the variables that will receive the result from a gfx_Orbit(..) function call	

2.8.17 gfx_Orbit(angle, distance)

Syntax	gfx_Orbit(angle, distance);	
Arguments	angle, distance	
	angle	Specifies the angle from the origin to the remote point. The angle is specified in degrees.
	distance	Specifies the distance from the origin to the remote point in pixel units.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
	Note: result is stored in the variables that were specified with the gfx_OrbitInit(..) function.	
Description	Prior to using this function, the destination address of variables for the calculated coordinates must be set using the gfx_OrbitInit(..) function. The gfx_Orbit(..) function calculates the x, y coordinates of a distant point relative to the current origin, where the only known parameters are the angle and the distance from the current origin. The new coordinates are calculated and then placed in the destination variables that have been previously set with the gfx_OrbitInit(..) function.	
Example	<pre>var targetX, targetY; gfx_OrbitInit(&targetX, &targetY); gfx_MoveTo(30, 30); gfx_Bullet(5) // mark the start point with a small WHITE circle gfx_Orbit(30, 50); // calculate a point 50 pixels away from origin at // 30 degrees gfx_CircleFilled(targetX,targetY,3,0xF800); // mark the target point // with a RED circle</pre>	

2.8.18 gfx_PutPixel(x, y, colour)

Syntax	gfx_PutPixel(x, y, colour);	
Arguments	x, y, colour	
	x, y	Specifies the screen coordinates of the pixel.
	colour	Specifies the colour of the pixel.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Draws a pixel at position x, y using the specified colour.	
Example	gfx_PutPixel(32, 32, 0xFFFF); This example draws a WHITE pixel at x=32, y=32	

2.8.19 gfx_GetPixel(x, y)

Syntax	gfx_GetPixel(x, y);	
Arguments	x, y	
	x, y	Specifies the screen coordinates of the pixel colour to be returned.
		The arguments can be a variable, array element, expression or constant
Returns	colour	
	colour	The 8 or 16bit colour of the pixel (default 16bit).
Description	Reads the colour value of the pixel at position x, y.	
Example	<pre>gfx_PutPixel(20, 20, 1234); r := gfx_GetPixel(20, 20); print(r);</pre>	
	This example prints 1234, the colour of the pixel that was previously placed.	

2.8.20 gfx_MoveTo(xpos, ypos)

Syntax	<code>gfx_MoveTo(xpos, ypos);</code>
Arguments	xpos, ypos xpos Specifies the horizontal position of the new origin. ypos Specifies the vertical position of the new origin. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Moves the origin to a new position.
Example	<pre>#inherit "4DGL_16bitColours.fnc" func help() var x, y, state; print("TOUCH ME"); touch_Set(TOUCH_ENABLE); // lets enable the touch screen while(touch_Get(TOUCH_STATUS) != TOUCH_PRESSED); //Wait for touch // we'll need a place on the screen to start with gfx_MoveTo(touch_Get(TOUCH_GETX), touch_Get(TOUCH_GETY)); gfx_Set(OBJECT_COLOUR, WHITE); // this will be our line colour while(1) state := touch_Get(TOUCH_STATUS); // Look for touch activity x := touch_Get(TOUCH_GETX); // Grab x and the y := touch_Get(TOUCH_GETY); // y coordinates of the touch if(state == TOUCH_PRESSED) // if there's a press gfx_LineTo(x, y); // Draw a line from previous spot endif if(state == TOUCH_RELEASED) // if there's a release; gfx_CircleFilled(x, y, 10, RED); // Draw a solid red circle endif if(state == TOUCH_MOVING) // if there's movement gfx_PutPixel(x, y, LIGHTGREEN); // we'll draw a green pixel endif wend // Repeat forever endfunc</pre>

2.8.21 gfx_MoveRel(xoffset, yoffset)

Syntax	gfx_MoveRel(xoffset, yoffset);	
Arguments	xoffset, yoffset	
	xoffset	Specifies the horizontal offset of the new origin.
	yoffset	Specifies the vertical offset of the new origin.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Moves the origin to a new position relative to the old position.	
Example	<pre>gfx_MoveTo(10, 20); gfx_MoveRel(-5, -3); gfx_Dot();</pre>	
	This example draws a pixel using the current object colour at x=5, y=17	

2.8.22 gfx_IncX()

Syntax	<code>gfx_IncX();</code>
Arguments	<code>none</code>
Returns	<code>old_origin</code>
	<code>old_origin</code> Returns the current X origin before the increment.
Description	Increment the current X origin by 1 pixel unit. The original value is returned before incrementing. The return value can be useful if a function requires the current point before insetting occurs.
Example	<pre>var n; gfx_MoveTo(20,20); n := 96; while (n--) gfx_ObjectColour(n/3); gfx_Bullet(2); gfx_IncX(); wend</pre> <p>This example draws a simple rounded vertical gradient.</p>

2.8.23 gfx_IncY()

Syntax	<code>gfx_IncY();</code>
Arguments	<code>none</code>
Returns	<code>old_Yorigin</code>
	<code>old_Yorigin</code> Returns the current Y origin before the increment.
Description	Increment the current Y origin by 1 pixel unit. The original value is returned before incrementing. The return value can be useful if a function requires the current point before insetting occurs.
Example	<pre>var n; gfx_MoveTo(20,20); n := 96; while (n--) gfx_ObjectColour(n/3); gfx_LineRel(20, 0); gfx_IncY(); wend</pre> <p>This example draws a simple horizontal gradient using lines.</p>

2.8.24 gfx_LineTo(xpos, ypos)

Syntax	<code>gfx_LineTo(xpos, ypos);</code>
Arguments	xpos, ypos
	xpos Specifies the horizontal position of the line end as well as the new origin.
	ypos Specifies the vertical position of the line end as well as the new origin.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a line from the current origin to a new position. The Origin is then set to the new position. The line is drawn using the current object colour. The line may be tessellated with the <code>gfx_LinePattern(...)</code> function.
Example	<pre>gfx_MoveTo(10, 20); gfx_LineTo(60, 70);</pre> <p>This example draws a line using the current object colour between x1=10, y1=20 and x2=60, y2=70. The new origin is now set at x=60, y=70.</p>

2.8.25 gfx_LineRel(xpos, ypos)

Syntax	<code>gfx_LineRel(xpos, ypos);</code>
Arguments	xpos, ypos
	xpos Specifies the horizontal end point of the line.
	ypos Specifies the vertical end point of the line.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a line from the current origin to a new position. The line is drawn using the current object colour. The current origin is not altered. The line may be tessellated with the gfx_LinePattern(...) function.
Example	<pre>gfx_LinePattern(0b1100110011001100); gfx_MoveTo(10, 20); gfx_LineRel(50, 50);</pre> <p>This example draws a tessellated line using the current object colour between 10,20 and 50,50. Note: <code>gfx_LinePattern(0);</code> must be used after this to return line drawing to normal solid lines.</p>

2.8.26 gfx_BoxTo(x2, y2)

Syntax	<code>gfx_BoxTo(x2, y2);</code>
Arguments	x2, y2 x2,y2 Specifies the diagonally opposed corner of the rectangle to be drawn, the top left corner (assumed to be x1, y1) is anchored by the current origin. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a rectangle from the current origin to the new point using the current object colour. The top left corner is anchored by the current origin (x1, y1), the bottom right corner is specified by x2, y2. Note: The default PEN_SIZE is set to OUTLINE , however, if PEN_SIZE is set to SOLID , the rectangle will be drawn filled, if PEN_SIZE is set to OUTLINE , the rectangle will be drawn as an outline. If the circle is drawn as SOLID , the outline colour can be specified with gfx_OutlineColour(...) . If OUTLINE_COLOUR is set to 0, no outline is drawn.
Example	<pre>gfx_MoveTo(40, 40); n := 10; while (n--) gfx_BoxTo(50, 50); gfx_BoxTo(30, 30); wend</pre> This example draws 2 boxes, anchored from the current origin.

2.8.27 gfx_Ellipse(x, y, xrad, yrad, colour)

Syntax	<code>gfx_Ellipse(x, y, xrad, yrad, colour);</code>
Arguments	x, y, xrad, yrad, colour
	x, y specifies the horizontal and vertical position of the centre of ellipse
	xrad, yrad Specifies x-radius and y-radius of the ellipse.
	colour Specifies the colour for the lines
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Plots a coloured Ellipse on the screen at centre x,y with xradius = xrad and yradius = yrad. if PenSize = 0 Ellipse is Solid if PenSize = 1 Ellipse is Outline
Example	<code>gfx_Ellipse(200, 80, 5, 10, YELLOW);</code>

2.8.28 gfx_EllipseFilled(x, y, xrad, yrad, colour)

Syntax	<code>gfx_EllipseFilled(x, y, xrad, yrad, colour);</code>
Arguments	x, y, xrad, yrad, colour
	x, y specifies the horizontal and vertical position of the centre of ellipse
	xrad, yrad Specifies x-radius and y-radius of the ellipse.
	colour Specifies the colour for the lines
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Plots a solid coloured Ellipse on the screen at centre x,y with xradius = xrad and yradius = yrad.
Example	<code>gfx_EllipseFilled(200, 110, 10, 5, GREEN);</code>

2.8.29 gfx_ScreenCopyPaste(xs, ys, xd, yd, width, height)

Syntax	<code>gfx_ScreenCopyPaste(xs, ys, xd, yd, width, height);</code>
Arguments	xs, ys, xd, yd, width, height
	xs, ys Specifies the horizontal and vertical position of the top left corner of the area to be copied (source).
	xd, yd Specifies the horizontal and vertical position of the top left corner of where the paste is to be made (destination).
	width Specifies the width of the copied area.
	height Specifies the height of the copied area.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Copies an area of a screen from xs, ys of size given by width and height parameters and pastes it to another location determined by xd, yd.
Example	<code>gfx_ScreenCopyPaste(10, 10, 100, 100, 40, 40); // Copies 40x40 pixels originating from point (10,10) to (100,100);</code>

2.8.30 gfx_RGBto565(RED, GREEN, BLUE)

Syntax	gfx_RGBto565(RED, GREEN, BLUE);
Arguments	RED, GREEN, BLUE
	RED 8bit colour value for RED.
	GREEN 8bit colour value for GREEN..
	BLUE 8bit colour value for BLUE.
	The arguments can be a variable, array element, expression or constant
Returns	Returns the 16bit (RED:5, GREEN:6, BLUE:5 format) colour value.
Description	Returns the 16bit (RED:5, GREEN:6, BLUE:5 format) colour value of a 24bit (RED:8, GREEN:8, BLUE:8 format) colour.
Example	<pre>var colorRGB; colorRGB := gfx_RGBto565(170, 126, 0); // convert 8bit Red, Green and Blue color values to 16bit 565 color value</pre>

2.8.31 gfx_332to565(COLOUR)

Syntax	<code>gfx_332to565(COLOUR);</code>
Arguments	COLOUR
	COLOUR 8bit colour value. 3bits for RED, 3bits for GREEN, 2bits for BLUE.
Returns	Returns the 16bit (RED:5, GREEN:6, BLUE:5 format) value
Description	Returns the 16bit (RED:5, GREEN:6, BLUE:5 format) value of an 8bit (RED:3, GREEN:3, BLUE:2 format) colour
Example	<pre>var color565; color565 := gfx_332to565(0b11010100); // Convert 8bit 332 color value to 16bit 565 color value</pre>

2.8.32 gfx_TriangleFilled(x1, y1, x2, y2, x3, y3, colour)

Syntax	gfx_TriangleFilled(x1, y1, x2, y2, x3, y3, colour);	
Arguments	x1, y1, x2, y2, x3, y3, colour	
	x1, y1	Specifies the first vertices of the triangle.
	x2, y2	Specifies the second vertices of the triangle.
	x3, y3	Specifies the third vertices of the triangle.
	colour	Specifies the colour for the triangle.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Draws a Solid triangle between vertices x1,y1 , x2,y2 and x3,y3 using the specified colour.	
Example	gfx_TriangleFilled(10,10,30,10,20,30,CYAN) ; This example draws a CYAN Solid triangle with vertices at 10,10 30,10 20,30	

2.8.33 gfx_PolygonFilled(n, vx, vy, colour)

Syntax	<code>gfx_PolygonFilled(n, vx, vy, colour);</code>
Arguments	n, vx, vy, colour n Specifies the number of elements in the x and y arrays specifying the vertices for the polygon. vx Specifies the addresses of the storage of the array of elements for the x coordinates of the vertices. vy Specifies the addresses of the storage of the array of elements for the y coordinates of the vertices. colour Specifies the colour for the polygon The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws a solid Polygon between specified vertices: x1,y1 x2,y2 .. xn,yn using the specified colour. The last point is drawn back to the first point, completing the polygon. Vertices must be minimum of 3 and can be specified in any fashion
Example	<pre>var vx[7], vy[7]; func main() vx[0] := 10; vy[0] := 10; vx[1] := 35; vy[1] := 5; vx[2] := 80; vy[2] := 10; vx[3] := 60; vy[3] := 25; vx[4] := 80; vy[4] := 40; vx[5] := 35; vy[5] := 50; vx[6] := 10; vy[6] := 40; gfx_PolygonFilled(7, vx, vy, RED); repeat forever endfunc</pre> <p>This example draws a simple filled polygon</p>

2.8.34 gfx_Origin(x, y)

Syntax	gfx_Origin(x, y);	
Arguments	x, y	
	x, y	Specifies the horizontal and vertical position of the top left corner of the clipping window.
Returns	nothing	
Description	Sets relative screen offset for horizontal and vertical for the top left corner for graphics objects.	
Example	gfx_Origin(10, 20); // Sets origin position at (10,20)	

2.8.35 gfx_SetClipRegion()

Syntax	<code>gfx_SetClipRegion();</code>
Arguments	none
Returns	nothing
Description	Forces the clip region to the most recent extents. It can be the extents of the last text that was printed or the last image that was shown. For the clipping region to take effect, "Clipping" setting must be enabled separately using gfx_Set(CLIPPING, ON) or the shortcut gfx_Clipping(ON) .
Example	<pre>gfx_MoveTo(10,10); // move the origin to a new pixel location (x,y) print("TEST"); // print a string gfx_SetClipRegion(); // force the clipping region to the extent of the text gfx_Clipping(ON); // turn ON clipping var n; n := 50000; while(n--) gfx_PutPixel(RAND()%100, RAND()%100, RAND()); wend repeat forever</pre> <p>This example will draw 50000 random colour pixels, only the pixels within region of the text will be visible</p>

2.8.36 gfx_ClipWindow(x1, y1, x2, y2)

Syntax	<code>gfx_ClipWindow(x1, y1, x2, y2);</code>
Arguments	x1, y1, x2, y2
	x1, y1 Specifies the horizontal and vertical position of the top left corner of the clipping window.
	x2, y2 Specifies the horizontal and vertical position of the bottom right corner of the clipping window.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Specifies a clipping window region on the screen such that any objects and text placed onto the screen will be clipped and displayed only within that region. For the clipping window to take effect, "Clipping" setting must be enabled separately using gfx_Set(CLIPPING, ON) or the shortcut gfx_Clipping(ON) .
Example	<pre>var n; gfx_ClipWindow(10, 10, 50, 50); gfx_Clipping(ON); n := 50000; while(n--) gfx_PutPixel(RAND()%100, RAND()%100, RAND()); wend repeat forever</pre> <p>This example will draw 50000 random colour pixels, only the pixels within the clipping area will be visible</p>

2.8.37 gfx_Get(mode)

Syntax	<code>gfx_Get(mode);</code>
Arguments	mode <ul style="list-style-type: none"> X_MAX : Current orientations maximum X Value Y_MAX : Current orientations maximum Y Value LEFT_POS : Left location of Object TOP_POS : Top location of Object RIGHT_POS : Right location of Object BOTTOM_POS : Bottom location of Object X_ORG : Get current internal X position Y_ORG : Get current internal Y position
Returns	X_MAX Returns the maximum horizontal value of the display. Y_MAX Returns the maximum vertical value of the display. LEFT_POS Returns the left location of the last drawn object such as a slider or button or an image/video. TOP_POS Returns the top location of the last drawn object such as a slider or button or an image/video. RIGHT_POS Returns the right location of the last drawn object such as a slider or button or an image/video. BOTTOM_POS Returns the bottom location of the last drawn object such as a slider or button or an image/video. X_ORG Returns the internal X position that was set with MoveTo(x, y); or gfx_Set(X_ORG, pos); Y_ORG Returns the internal Y position that was set with MoveTo(x, y); or gfx_Set(Y_ORG, pos);
Description	Returns various graphics parameters to caller.
Example	<pre> var := gfx_Get(X_MAX); //Returns the maximum horizontal resolution of the display var := gfx_Get(0); var := gfx_Get(Y_MAX); //Returns the maximum vertical resolution of the display var := gfx_Get(1); var := gfx_Get(RIGHT_POS); //Returns the right location of the last drawn object //that only has top, left parameters such as a button // or an image/video. var := gfx_Get(2); var := gfx_Get(BOTTOM_POS); //Returns the bottom location of the last drawn object //that only has top, left parameters such as a button //or an image/video. var := gfx_Get(3); </pre>

2.8.38 gfx_Set(function, value)

Syntax	gfx_Set(function, value);	
Arguments	function, value	
	function	The function number determines the required action for various graphics control functions. Usually a constant, but can be a variable, array element, or expression. There are pre-defined constants for each of the functions.
	value	A variable, array element, expression or constant holding a value for the selected function.
Returns	nothing	
Description	Given a function number and a value, set the required graphics control parameter, such as size, colour, and other parameters. (see the Single parameter short-cuts for the gfx_Set functions below).	
function		value
Predefined Name	Description	
PEN_SIZE	Set the draw mode for gfx_LineTo, gfx_LineRel, gfx_Dot, gfx_Bullet and gfx_BoxTo (default mode is OUTLINE) nb:- pen size is set to OUTLINE for normal operation	0 or SOLID 1 or OUTLINE
BACKGROUND_COLOUR	Set the screen background colour	Colour, 0-65535
OBJECT_COLOUR	Generic colour for gfx_LineTo(...), gfx_LineRel(...), gfx_Dot(), gfx_Bullet(...) and gfx_BoxTo(...)	Colour, 0-65535
CLIPPING	Turns clipping on/off. The clipping points are set with gfx_ClipWindow(..) and must be set first.	1 or 0 (ON or OFF)
TRANSPARENT_COLOUR	Colour that needs to be made transparent.	Colour, 0-65535
TRANSPARENCY	Turn the transparency ON or OFF. Transparency is automatically turned OFF after the next image or video command.	1 or 0 (ON or OFF)
FRAME_DELAY	Set the inter frame delay for media_Video(..)	0 to 255msec
SCREEN_MODE	Set required screen behaviour/orientation.	0 or LANDSCAPE 1 or LANDSCAPE_R 2 or PORTRAIT 3 or PORTRAIT_R
OUTLINE_COLOUR	Outline colour for rectangles and circles (set to 0 for no effect)	Colour, 0-65535
CONTRAST	Set contrast value, 0 = display off, 1-15 = contrast level	0 or OFF 1 to 15 for levels
BEVEL_WIDTH	Set Button Bevel Width, 0 pixel to 15pixels.	0 None 1 to 15 pixels

Single parameter short-cuts for the gfx_Set(..) functions

Function Syntax	Function Action	value
gfx_PenSize(mode)	Set the draw mode for gfx_LineTo, gfx_LineRel, gfx_Dot, gfx_Bullet and gfx_BoxTo Note: pen size is set to OUTLINE for normal operation (default).	0 or SOLID 1 or OUTLINE

gfx_BGcolour(colour)	Set the screen background colour	Colour 0-65535
gfx_ObjectColour(colour)	Generic colour for gfx_LineTo(...), gfx_LineRel(...), gfx_Dot(), gfx_Bullet(...) and gfx_BoxTo	Colour 0-65535
gfx_Clipping(mode)	Turns clipping on/off. The clipping points are set with gfx_ClipWindow(...)	0 or 1 (ON or OFF)
gfx_TransparentColour(colour)	Colour that needs to be made transparent.	Colour, 0-65535
gfx_Transparency(mode)	Turn the transparency ON or OFF.	1 or 0 (ON or OFF)
gfx_FrameDelay(delay)	Set the inter frame delay for media_Video(...)	0 to 255msec
gfx_ScreenMode(mode)	Graphics orientation LANDSCAPE, LANDSCAPE_R, PORTRAIT, PORTRAIT_R	1 or LANDSCAPE 2 or LANDSCAPE_R 3 or PORTRAIT 4 or PORTRAIT_R
gfx_OutlineColour(colour)	Outline colour for rectangles and circles. (set to 0 for no effect)	Colour 0-65535
gfx_Contrast(value)	Set contrast value, 0 = display off, 1-15 = contrast level	0 or OFF 1 to 15 for levels
gfx_LinePattern(pattern)	Sets the line draw pattern for line drawing. If set to zero, lines are solid, else each '1' bit represents a pixel that is turned off. See code examples for further reference.	0 bits for pixels on 1 bits for pixels off
gfx_ColourMode(mode)	Sets 8 or 16bit colour mode Function not available, fixed as 16bit mode.	0 or COLOUR16 1 or COLOUR8
gfx_BevelWidth(mode)	graphics button bevel width	0 None 1 to 15 pixels
gfx_BevelShadow(value)	graphics button bevel shadow depth	
gfx_Xorigin(offset)	graphics X origin	
gfx_Yorigin(offset)	graphics Y origin	

2.8.39 gfx_RingSegment(x, y, Rad1, Rad2, starta, enda, colour)

Syntax	gfx_RingSegment(x, y, Rad1, Rad2, starta, enda, colour)
Arguments	x, y, Rad1, Rad2, starta, enda, colour
	x, y Center
	Rad1 Outer radius
	Rad2 Inner radius
	starta Start angle
	enda End angle
	colour Colour
Returns	nothing
Description	Draw a Segment of a ring at x, y from rad2 to rad1 starting at starta to enda in colour.
Example	gfx_RingSegment(100, 100, 50, 25, 90, 180, LIME);

2.8.40 gfx_ReadGRAMarea(x1, y1, x2, y2, ptr)

Syntax	gfx_ReadGRAMarea(x1, y1, x2, y2, ptr);	
Arguments	x1, y1, x2, y2, ptr	
	x1, y1	Top left corner of the rectangular area.
	x2, y2	Bottom right corner of the rectangular area.
	ptr	If zero is passed, an array of the required size to map the line is created. If non zero, it is expected that this is a pointer to an array large enough to store each pixel that is read.
Returns	value	
	value	A pointer to the created array, or the users array. In the case of ptr=0, if there is insufficient memory to create the array, zero is returned.
Description	Reads an arbitrary rectangular area from the display to an array. If "ptr" is 0, the correctly sized array is created, in which case it is up to the caller to eventually destroy it. Otherwise "ptr" is expected to point to a correctly sized array. Note: If an array is supplied, its size must be large enough, and may be calculated: <pre>bytecount := ((ABS(x2-x1)+1) * (ABS(y2-y1) + 1)) * 2; // calc array size for mem_Alloc (which allocates byte storage)</pre> <pre>wordcount := ((ABS(x2-x1)+1) * ABS(y2-y1); // calc array size for fixed word array</pre>	
Example	<pre>var array; array := gfx_ReadGRAMarea(50,50,250,175,0); // Copy the pixels of the GRAM area with top left and bottom right // endpoints at (50,50) and (250,175) and saves it to the generated // array. The address is then returned and saved to variable 'array' gfx_BGcolour(LIME); gfx_Cls(); // Sets the background to a single color gfx_WriteGRAMarea(100,100,300,225,array); // Copies the GRAM area to the new coordinates, // Top left and bottom right corners are at (100,100) and (300,225)</pre>	

2.8.41 gfx_WriteGRAMarea(x1, y1, x2, y2, ptr)

Syntax	gfx_WriteGRAMarea(x1, y1, x2, y2, ptr);	
Arguments	x1, y1, x2, y2, ptr	
	x1, y1	Top left corner of the rectangular area.
	x2, y2	Bottom right corner of the rectangular area.
	ptr	Points to an array to be written.
Returns	nothing	
Description	Write an array back to the rectangular area	
Example	See gfx_ReadGRAMarea(...) example.	

2.8.42 gfx_Surround(x1, y1, x2, y2, rad1, rad2, colour)

Syntax	<code>gfx_Surround(x1, y1, x2, y2, rad1, rad2, color);</code>
Arguments	x1, y1, x2, y2, rad1, rad2, oct, color x1, y1 Specifies the top left corner position of the surround on the screen. x2, y2 Specifies the bottom right corner position of the surround on the screen. rad1 Inner corner radius. rad2 Outer corner radius. color The colour of the surround. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Draws an outline rectangle at the given co-ordinates with optional rounded corners determined by ' rad1 '. ' rad2 ' sets the radius of the outer rounded rectangle. If ' rad1 ' is zero, the inner rectangle will have square corners. Bounding rectangle is $x1-rad1-rad2, y1-rad1-rad2, x2+rad1+rad2, y2+rad1+rad2$.
Example	<code>gfx_Surround(40, 40, 100, 60, 15, 3, YELLOW);</code> Draw a surround with rounded corners, 3 pixels wide

2.8.43 gfx_Gradient(style, x1, y1, x2, y2, color1, color2)

Syntax	<code>gfx_Gradient(style, x1, y1, x2, y2, color1, color2);</code>
Arguments	style, x1, y1, x2, y2, color1, color2
	style Specifies gradient style. GRAD_DOWN gradient changes in the vertical direction GRAD_RIGHT gradient change in the horizontal direction GRAD_UP gradient changes in the vertical direction GRAD_LEFT gradient change in the horizontal direction GRAD_WAVE_VER gradient wave in the vertical direction GRAD_WAVE_HOR gradient wave in the horizontal direction
	x1, y1 Specifies top left corner of the rectangle.
	x2, y2 Specifies bottom right corner of the rectangle.
	color1 Specifies starting colour.
	color2 Specifies ending colour.
Returns	nothing
Description	Draws a graduated colour rectangle at the specified co-ordinate.
Example	<code>gfx_Gradient(GRAD_WAVE_VER, 100, 100, 230, 120, BLACK, WHITE); //Draw graduated colour rectangle</code>

2.8.44 gfx_RoundGradient(style, x1, y1, x2, y2, radius, color1, color2)

Syntax	<code>gfx_RoundGradient(style, x1, y1, x2, y2, radius, color1, color2);</code>
Arguments	style, x1, y1, x2, y2, radius, color1, color2
	style Specifies gradient style. GRAD_DOWN gradient changes in the vertical direction GRAD_RIGHT gradient change in the horizontal direction GRAD_UP gradient changes in the vertical direction GRAD_LEFT gradient change in the horizontal direction GRAD_WAVE_VER gradient wave in the vertical direction GRAD_WAVE_HOR gradient wave in the horizontal direction
	x1, y1 Specifies top left corner of the rectangle
	x2, y2 Specifies bottom right corner of the rectangle
	radius Specifies the corner radius
	color1 Specifies starting colour
	color2 Specifies ending colour
Returns	nothing
Description	Draws a graduated colour rounded rectangle at the specified co-ordinate. X1 may equal X2, and Y1 = Y2 allowing the function to be used for rounded panels, rounded buttons, circular buttons. Bounding rectangle is x1-radius, y1-radius, x2+radius, y2+radius.
Example	<code>gfx_Gradient(GRAD_WAVE_VER, 100, 100, 230, 120, 20, BLACK, WHITE); //Draw graduated colour rounded rectangle</code>

2.8.45 gfx_XYrotToVal(x, y, base, mina, maxa, minv, maxv)

Syntax	gfx_XYrotToVal(x, y, base, mina, maxa, minv, maxv)	
Arguments	x, y, base, mina, maxa, minv, maxv	
	x	Relative x-coordinate (x-coordinate – x-center)
	y	Relative y-coordinate (y-coordinate – y-center)
	base	The base reference at which the angle is 0. XYROT_EAST angle 0 starts from the east XYROT_SOUTH angle 0 starts from the south
	mina	Start angle (Clockwise from 0 angle)
	maxa	End angle (Clockwise from 0 angle)
	minv	Minimum value
	maxv	Maximum value
Returns	value	
	value	The equivalent position, the value of which will be between minv and maxv .
Description	This function converts a rotational angle into a value. It calculates a position for a rotary input starting at mina and continuing to maxa . Both angles must be greater than 0.	
Example	<pre>var pos; pos := gfx_XYrotToVal(150 - 100, 150 - 100, XYROT_EAST, 0, 180, 0, 100); print(pos); // Prints value of 25, expected at angle of 45 degrees with the origin at x = 100, y = 100</pre>	

2.8.46 gfx_XYlinToVal(x, y, base, minpos, maxpos, minv, maxv)

Syntax	gfx_XYlinToVal(x, y, base, minpos, maxpos, minv, maxv)	
Arguments	x, y, base, minpos, maxpos, minv, maxv	
	x, y	x and y position values
	base	Base reference axis XYLIN_X to use the x value for calculations (Horizontal axis) XYLIN_Y to use the y value for calculations (Vertical axis)
	minpos	Start position
	maxpos	End position
	minv	Minimum value
	maxv	Maximum value
Returns	value	
	value	The equivalent position, the value of which will be between minv and maxv .
Description	This function converts a linear position into a value. It calculates a position for a linear input starting at minpos and continuing to maxpos .	
Example	<pre>var pos; pos := gfx_XYlinToVal(100, 100, XYLIN_X, 0, 200, 0, 100); print(pos); //Prints 50, after mapping to min and max value</pre>	

2.8.47 gfx_SpriteSet(bitmap, colours, palette)

Syntax	gfx_SpriteSet(bitmap, colours, palette);						
Arguments	bitmap, colours, palette						
	<table border="1"> <tr> <td>bitmap</td><td>Pointer to bitmap</td></tr> <tr> <td>colours</td><td>Pointer to colour lookup table</td></tr> <tr> <td>palette</td><td>Pointer to the 4 colour palettes</td></tr> </table>	bitmap	Pointer to bitmap	colours	Pointer to colour lookup table	palette	Pointer to the 4 colour palettes
bitmap	Pointer to bitmap						
colours	Pointer to colour lookup table						
palette	Pointer to the 4 colour palettes						
Returns	nothing						
Description	<p>This function sets the internal pointers for the 3 sets of data required by the sprite generator which are as follows:</p> <ol style="list-style-type: none"> 1. the bitmaps for the sprites 2. the colour lookup table (CLUT) 3. the 4 colour palettes 						
Example	<pre> #DATA word mySprites // cherry 0x0000,0x0000, // line 1 0x0000,0x0000, // line 2 0x0000,0x0500, // line 3 11 0x0000,0x0550, // line 4 1111 0x0000,0x0045, // line 5 11 1 0x4000,0x0040, // line 6 1 1 0x1FC0,0x0010, // line 7 3331 1 0xF7F0,0x0004, // line 8 333133 1 0x3FF0,0x00F7, // line 9 33333 3133 0xCFB0,0x03F7, // line 10 3233 331333 0xCEF0,0x03FF, // line 11 3323 333333 0xCFC0,0x03FE, // line 12 333 323333 0xC000,0x03FB, // line 13 332333 0x0000,0x00FF, // line 14 3333 0x0000,0x0000, // line 15 3333 0x0000,0x0000 // line 16 word myColours BLACK, RED, LIME, WHITE byte myPalette 0,2,3,1 // BLACK, LIME, WHITE, RED #END func main() gfx_SpriteSet(mySprites, myColours, myPalette); gfx_BlitSprite(0, 0, 10, 10, SOUTH, 0); // example show a cherry upside down using the first palette of myPalette as set by gfx_SpriteSet repeat forever endfunc </pre>						

2.8.48 gfx_BlitSprite(spritenumber, palette, xpos, ypos, orientation, preimage)

Syntax	<code>gfx_BlitSprite(spritenumber, palette, xpos, ypos, orientation, preimage)</code>																		
Arguments	spritenumber, palette, xpos, ypos, orientation, preimage																		
	spritenumber Index of sprite to be shown.																		
	palette Index of the colour palette to be used. Value can be from 0 to 3.																		
	xpos, ypos x and y coordinates of position at which the sprite will be shown																		
	Direction of the sprite when shown. Possible values for orientation:																		
	<table border="1"><thead><tr><th>Constant Name</th><th>Value</th></tr></thead><tbody><tr><td>NORTH</td><td>0</td></tr><tr><td>SOUTH</td><td>1</td></tr><tr><td>WEST</td><td>2</td></tr><tr><td>EAST</td><td>3</td></tr><tr><td>NORTH_MIRRORED</td><td>4</td></tr><tr><td>SOUTH_MIRRORED</td><td>5</td></tr><tr><td>WEST_MIRRORED</td><td>6</td></tr><tr><td>EAST_MIRRORED</td><td>7</td></tr></tbody></table>	Constant Name	Value	NORTH	0	SOUTH	1	WEST	2	EAST	3	NORTH_MIRRORED	4	SOUTH_MIRRORED	5	WEST_MIRRORED	6	EAST_MIRRORED	7
Constant Name	Value																		
NORTH	0																		
SOUTH	1																		
WEST	2																		
EAST	3																		
NORTH_MIRRORED	4																		
SOUTH_MIRRORED	5																		
WEST_MIRRORED	6																		
EAST_MIRRORED	7																		
	preimage Pointer to a preimage, if required.																		
Returns	nothing																		
Description	Places the required sprite bitmap at the origin xpos, ypos using the required 4 colour palette. Orientation determines in which direction the sprite will be displayed. If preimage exists it should be large enough to hold the entire image 'underneath' the sprite.																		
Example	See the example in section gfx_SpriteSet()																		

2.8.49 gfx_Button(state, x, y, buttonColour, txtColour, font, txtWidth txtHeight, text)

Syntax	<code>gfx_Button(state, x, y, buttonColour, txtColour, font, txtWidth, txtHeight, text);</code>
Arguments	state, x, y, buttonColour, txtColour, font, txtWidth, txtHeight, text
	state 0 = Button depressed; 1 = Button raised.
	x, y Specifies the top left corner position of the button on the screen.
	buttonColour Button colour
	txtColour Text Colour
	font Specifies the Font ID.
	txtWidth Specifies the width of the text. This value is the font width multiplier and minimum value must be 1.
	txtHeight Specifies the height of the text. This value is the font height multiplier and minimum value must be 1.
	text Specifies the text string. The text string must be within the range of printable ascii character set. The string may have \n characters embedded to create a multiline button.
Returns	nothing
Description	Draws a three-dimensional Text Button at screen location defined by x, y parameters (top left corner). The size of the button depends on the font, width, height and length of the text. The button can contain multiple lines of text by having the \n character embedded in the string for the end of line marker. In this case, the widest text in the string sets the overall width, and the height of the button is set by the number of text lines. In the case of multiple lines, each line is left justified. If you wish to centre or right justify the text, you will need to prepare the text string according to your requirements.
Example	<pre>#constant LEFT 30 #constant TOP 150 #constant TEXTWIDTH 2 #constant TEXTHEIGHT 2 //----- func main() // Draw a button as a Text Box (indented) gfx_Button(DOWN, 0, 30, GREEN, WHITE, FONT3, TEXTWIDTH, TEXTHEIGHT, "4DGL-Demo"); touch_Set(TOUCH_ENABLE); repeat // Draw the Push Button (raised) gfx_Button(UP, LEFT, TOP, BLUE, RED, FONT3, TEXTWIDTH, TEXTHEIGHT, " PRESS "); // set touch detect region to that of the push button touch_DetectRegion(LEFT, TOP, gfx_Get(RIGHT_POS), gfx_Get(BOTTOM_POS)); // Wait until the button is pressed while(touch_Get(TOUCH_STATUS) != TOUCH_PRESSED); // now redraw the Push Button (depressed)</pre>

```
gfx_Button(DOWN, LEFT, TOP, BLUE, WHITE, FONT3, TEXTWIDTH,  
TEXTHEIGHT, " PRESS ");  
  
// Wait until the button is pressed  
while(touch_Get(TOUCH_STATUS) != TOUCH_RELEASED);  
forever  
endfunc
```

2.8.50 gfx_Button4(state, &gfx_ButtonRam, &gfx_ButtonDef)

Syntax	gfx_Button4(state, &gfx_ButtonRam, &gfx_ButtonDef)	
Arguments	state, &gfx_ButtonRam, &gfx_ButtonDef	
	state	A value (usually a constant) specifying the current frame of the widget
	&gfx_ButtonRam	A pointer to a variable array for widget utilization
	&gfx_ButtonDef	A pointer to the Data Block holding the widget parameters
Widget Parameter Data Block Format		
#DATA		
// Circular button with braille grid pattern on button face		
word Button1Info	10,	// Top-Left X-position
	10,	// Top-Left Y-position
	50,	// Radius
	0x9CD3,	// Outer bevel gradient color 1
	0x5ACB,	// Outer bevel gradient color 2
	GRAD_WAVE_VER,	// Outer bevel gradient style
	0x8800,	// Ring Color (at state 0)
	0xF800,	// Ring Color (at state 1)
	0xDEDB,	// Button bevel gradient color 1
	0x2104,	// Button bevel gradient color 2
	GRAD_DOWN,	// Button bevel gradient (at state 0)
	GRAD_UP,	// Button bevel gradient (at state 1)
	0x6B6D,	// Button face color
	0,	// Button text (numeric zero (0) for Braille design)
	0xBDD7,	// Braille grid gradient color 1
	0x2965,	// Braille grid gradient color 2
	GRAD_DOWN	// Braille grid gradient style
// Circular button with Text on button face		
word Button2Info	120,	// Top-Left X-position
	10,	// Top-Left Y-position
	50,	// Radius
	0x9CD3,	// Outer bevel gradient color 1
	0x5ACB,	// Outer bevel gradient color 2
	GRAD_WAVE_VER,	// Outer bevel gradient style
	0x8800,	// Ring color (at state 0)
	0xF800,	// Ring color (at state 1)
	0xDEDB,	// Button bevel gradient color 1
	0x2104,	// Button bevel gradient color 2
	GRAD_DOWN,	// Button bevel gradient (at state 0)
	GRAD_UP,	// Button bevel gradient (at state 1)
	0x6B6D,	// Button face color
	ButtonText,	// Button text label (Use pointer)
	0xFFFF,	// Button text font color (at state 0)
	0x0,	// Button text font color (at state 1)
	FONT1,	// Button text font style
	1	// Button text size multiplier
byte ButtonText	"Button\0"	// Button label string (Use null terminator "\0" to end string)
#END		

Returns	nothing
Description	Draw a Button as defined by ButtonDef (if required), using ButtonRam positioning at position value. See the reference for the ButtonDef values.
Example	<pre>var state; var Button1Ram[10]; var Button2Ram[10]; #DATA word Button1Info 0, 0, 50, 0x9CD3, 0x5ACB, GRAD_WAVE_VER, 0x8800, 0xF800, 0xDEDB, 0x2104, GRAD_DOWN, GRAD_UP, 0x6B6D, 0, 0xBDD7, 0x2965, GRAD_DOWN word Button2Info 10, 120, 50, 0x9CD3, 0x5ACB, GRAD_WAVE_VER, 0x8800, 0xF800, 0xDEDB, 0x2104, GRAD_DOWN, GRAD_UP, 0x6B6D, ButtonText, 0xFFFF, 0x0, FONT1, 1 byte ButtonText "Button\0" #END func main() gfx_Button4(state, Button1Ram, Button1Info); // Button with braille gfx_Button4(state, Button2Ram, Button2Info); // Button with text repeat forever endfunc</pre>

2.8.51 gfx_Switch(state, &SwitchRam, &SwitchDef)

Syntax	<code>gfx_Switch(state, &SwitchRam, &SwitchDef)</code>	
Arguments	state, &SwitchRam, &SwitchDef	
	state	A value (usually a constant) specifying the current frame of the widget
	&SwitchRam	A pointer to a variable array for widget utilization
	&SwitchDef	A pointer to the Data Block holding the widget parameters
Widget Parameter Data Block Format		
#DATA		
<pre>word Button1Info 10, // Top-Left X-position 10, // Top-Left Y-position 90, // Widget length 49, // Widget height 1, // Option bits (See Widget Parameter Data Block Option Bits) 0x9772, // Container bevel main color 0x8C1, // Container bevel shadow color 4, // Container bevel thickness 3, // Switch bevel thickness 0x1C43, // Switch face color (State 1) 0x32A6, // Switch face color (State 0) Button1LabelOn, // Container text (State 1) Button1LabelOff, // Container text (State 0) 3, // Container text font style 1, // Container text size multiplier 0xFFFF, // Container text color (State 1) 0x120 // Container text color (State 0)</pre>		
byte Button1LabelOn "ON\0" // Button label string (Use null terminator "\0" to end string)		
byte Button1LabelOff "OFF\0" // Button label string (Use null terminator "\0" to end string)		
#END		
Widget Parameter Data Block Option Bits		
<pre>SWITCH1_F_ORIENT_VERT Vertical orientation set bit</pre>		
Returns	nothing	
Description	Draw a Switch as defined by SwitchDef (if required), using SwitchRam positioning at position value.	
Example	<pre>var state; var Button1Ram[10]; #DATA word Button1Info 10, 10, 90, 49, 1, 0x9772, 0x8C1, 4, 3, 0x1C43, 0x32A6, Button1LabelOn, Button1LabelOff, FONT3, 1, 0xFFFF, 0x120 byte Button1LabelOn "ON\0" byte Button1LabelOff "OFF\0" #END func main() gfx_Switch(state, Button1Ram, Button1Info); // Button Internal Widget repeat forever endfunc</pre>	

2.8.52 gfx_Slider(mode, x1, y1, x2, y2, colour, scale, value)

Syntax	<code>gfx_Slider(mode, x1, y1, x2, y2, colour, scale, value);</code>												
Arguments	mode, x1, y1, x2, y2, colour, scale, value												
	<table border="1"> <tr> <td>mode</td><td>mode = 0 : Slider Indented, mode = 1 : Slider Raised, mode 2, Slider Hidden (background colour).</td></tr> <tr> <td>x1, y1</td><td>specifies the top left corner position of the slider on the screen.</td></tr> <tr> <td>x2, y2</td><td>specifies the bottom right corner position of the slider on the screen.</td></tr> <tr> <td>colour</td><td>specifies the colour of the Slider bar.</td></tr> <tr> <td>scale</td><td>scale = n : sets the full scale range of the slider for the thumb from 0 to n.</td></tr> <tr> <td>value</td><td>if value positive, sets the relative position of the thumb on the slider bar, else set thumb to ABS position of the negative number.</td></tr> </table>	mode	mode = 0 : Slider Indented, mode = 1 : Slider Raised, mode 2, Slider Hidden (background colour).	x1, y1	specifies the top left corner position of the slider on the screen.	x2, y2	specifies the bottom right corner position of the slider on the screen.	colour	specifies the colour of the Slider bar.	scale	scale = n : sets the full scale range of the slider for the thumb from 0 to n.	value	if value positive, sets the relative position of the thumb on the slider bar, else set thumb to ABS position of the negative number.
mode	mode = 0 : Slider Indented, mode = 1 : Slider Raised, mode 2, Slider Hidden (background colour).												
x1, y1	specifies the top left corner position of the slider on the screen.												
x2, y2	specifies the bottom right corner position of the slider on the screen.												
colour	specifies the colour of the Slider bar.												
scale	scale = n : sets the full scale range of the slider for the thumb from 0 to n.												
value	if value positive, sets the relative position of the thumb on the slider bar, else set thumb to ABS position of the negative number.												
Returns	<p>If the value parameter was a positive number (i.e:- value is a proportion of the scale parameter) , the true (implied x or y axis) position of the thumb is returned.</p> <p>If the value parameter was a negative number (i.e:- thumb is being set to an Absolute graphics position), the actual slider value (which is a proportion of the scale parameter) is returned.</p>												
Description	<p>Draws a vertical or horizontal slider bar on the screen. The gfx_Slider function has several different modes of operation. In order to minimise the amount of graphics functions we need, all modes of operation are selected naturally depending on the parameter values.</p> <p>Selection rules:</p> <p>1a] if $x2-x1 > y2-y1$ slider is assumed to be horizontal (ie: if width > height, slider is horizontal)</p> <p>1b] if $x2-x1 <= y2-y1$ slider is assumed to be vertical (ie: if height <= width, slider is horizontal)</p> <p>2a] If value is positive, thumb is set to the position that is the proportion of value to the scale parameter.(used to set the control to the actual value of a variable)</p> <p>2b] If value is negative, thumb is driven to the graphics position set by the ABSolute of value value. (used to set thumb to its actual graphical position (usually by touch screen))</p> <p>3] The thumb colour is determine by gfx_Set(OBJECT_COLOUR, value); , however, if the current object colour is BLACK, a darkened shade of the colour parameter is used for the thumb .</p>												
Example	<pre>func drawRedSlider() gfx_Slider(0,rSlider[0],rSlider[1],rSlider[2],rSlider[3],RED,255, valR); txt_MoveCursor(1,12); txt_Set(TEXT_OPACITY, OPAQUE); txt_Set(TEXT_COLOUR, RED); print (" "); txt_MoveCursor(1,12); print ([DEC] valR); endfunc</pre>												

2.8.53 gfx_Slider5(value, &SliderRam, &SliderDef)

Syntax	gfx_Slider5(value, &SliderRam, &SliderDef)	
Arguments	value, &SliderRam, &SliderDef	
	value	A value (usually a constant) specifying the current frame of the widget
	&SliderRam	A pointer to a variable array for widget utilization
	&SliderDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

```
#DATA
word Slider1Info    10,           // Top-Left X-position
                    10,           // Top-Left Y-position
                    250,          // Widget length
                    40,           // Widget width
                    (0 + 0 + 0),   // Option bits (See Widget Parameter Data Block Option Bits)
                    0,            // Minimum value
                    100,          // Maximum value
                    0x1082,        // Base color
                    0x0,           // Track fill color (from Right/Top to current position)
                    0x7E0,          // Track fill color (from Left/Bottom to current position)
                    30,            // Total Marker partition for Top/Left Side (0 for no ticks)
                    30,            // Total Marker partition for Bottom/Right Side (0 for no ticks)
                    2,             // Minor ticks between each major ticks T/L Side (0 for small ticks)
                    2,             // Minor ticks between each major ticks B/R Side (0 for small ticks)
                    10,            // Major tick length
                    0x7E0,          // Major tick color
                    5,             // Minor tick length
                    0x7E0,          // Minor tick color
                    FONT3,          // Value indicator font style
                    0xFFE0,          // Value indicator text color
                    0x1082,          // Slider knob bevel gradient color 1
                    0x9CD3,          // Slider knob bevel gradient color 2
                    GRAD_DOWN,        // Slider knob bevel gradient style
                    0x1082,          // Slider knob face gradient color 1
                    0x9CD3,          // Slider knob face gradient color 2
                    GRAD_UP           // Slider knob face gradient style
#END
```

Widget Parameter Data Block Option Bits

SLIDER5_F_ORIENT_VERT	Set bit for vertical orientation
SLIDER5_F_TICKS	Set bit for enabling marker ticks*/
SLIDER5_F_VALUE_IND	Set bit for Enabling value indicator */
SLIDER5_F_PROGRESSBAR	Set bit for turning the slider into a gauge widget (Removes Knob)

Returns	nothing
Description	Draw a Slider as defined by SliderDef (if required), using SliderRam positioning at position value.
Example	<pre>var frame; var Slider1Ram[10];</pre>

```
var Gauge1Ram[10];

#DATA
word Slider1Info 10, 10, 250, 40, (0 + 0 + 0), 0, 100, 0x1082, 0x0, 0x7E0,
30, 30, 2, 2, 10, 0x7E0, 5, 0x7E0, FONT3, 0xFFE0, 0x1082, 0x9CD3, GRAD_DOWN,
0x1082, 0x9CD3, GRAD_UP

word Gauge1Info      10,   60,   250,   40,   (SLIDER5_F_PROGRESSBAR +
SLIDER5_F_ORIENT_VERT + SLIDER5_F_TICKS + SLIDER5_F_VALUE_IND), 0, 100,
0x1082, 0x0, 0x7E0, 30, 30, 2, 2, 10, 0x7E0, 5, 0x7E0, FONT3, 0xFFE0, 0x1082,
0x9CD3, GRAD_DOWN, 0x1082, 0x9CD3, GRAD_UP
#END

func main()
    gfx_Slider5(frame, Slider1Ram, Slider1Info); // Slider Internal Widget
    gfx_Slider5(frame, Gauge1Ram, Gauge1Info); // Gauge Internal Widget
repeat forever
endfunc
```

2.8.54 gfx_Dial(value, &DialRam, &DialDef)

Syntax	gfx_Dial(value, &DialRam, &DialDef)	
Arguments	value, &DialRam, &DialDef	
	value	A value (usually a constant) specifying the current frame of the widget
	&DialRam	A pointer to a variable array for widget utilization
	&DialDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

#DATA

```

word Knob1Info      10,          // Top-Left X-position
                    10,          // Top-Left Y-position
                    152,         // Width
                    129,         // Height
                    87,          // Knob centre X-position
                    80,          // Knob centre Y-position
                    38,          // Knob radius
                    135,         // Rotation starting angle
                    405,         // Rotation ending angle
                    0,           // Minimum value
                    100,          // Maximum value
                    0x0,          // Background color
                    0x52AA,        // Knob color
                    5,            // Bevel thickness
                    0xB5B6,        // Bevel gradient color 1 (Left side)
                    0x3186,        // Bevel gradient color 2 (Right side)
                    200,          // Starting angle for Partition 2
                    300,          // Starting angle for Partition 3
                    0x280,         // Partition 1 low color
                    0x528A,         // Partition 2 low color
                    0x5800,         // Partition 3 low color
                    0x7E0,          // Partition 1 high color
                    0xFFE0,          // Partition 2 low color
                    0xF800,          // Partition 3 low color
                    12,            // Indicator ticks offset distance
                    3,              // Indicator size 1 (Radius/Width of circle, triangle or rectangle)
                    6,              // Indicator size 2 (Length of line, triangle or rectangle)
                    0xF800,        // Knob pointer color
                    3,              // Knob pointer size 1 (Radius/Width of circle, triangle or rectangle)
                    30,             // Knob pointer size 2 (Length of line, triangle or rectangle)
                    0xFFFF,         // Knob indicator label text color
                    2,              // Knob indicator label font style
                    22,             // Knob indicator label offset distance
                    10,             // Number of indicator labels
                    0, /*Labels*/ // Pointer to string indicator labels (Numeric labels if zero (0))
                    2,              // Caption font style
                    0xFFFF,         // Caption text color
                    -15,            // Caption horizontal offset from knob centre
                    50,             // Caption vertical offset from knob centre
                    Caption,        // Knob Caption text
                    (0 + 0 + 0)     // Option bits (See Widget Parameter Data Block Option Bits)
    
```

```

byte Caption    "KNOB\0"                                // Caption string (Use null terminator "\0" to end string)
byte Labels    "Text1\0Text2\0Text3\0Text4\0Text5\0"   // Label text strings (Use null terminator "\0" as separators)

#END

```

Widget Parameter Data Block Option Bits

DIAL_F_LABEL_STRINGS	Set bit for dial indicator string (default is numeric)
DIAL_F_BG_TRANSPARENT	Set bit for widget transparency
DIAL_F_HANDLE_CIRCLE	Set bit for circular knob pointer style
DIAL_F_HANDLE_TRIANGLE	Set bit for triangular knob pointer style
DIAL_F_HANDLE_RECTANGLE	Set bit for rectangular pointer style
DIAL_F_HANDLE_LINE	Set bit for line pointer style
DIAL_F_INDICATOR_CIRCLE	Set bit for circular dial indicator style
DIAL_F_INDICATOR_TRIANGLE	Set bit for triangular dial indicator style
DIAL_F_INDICATOR_RECTANGLE	Set bit for rectangular dial indicator style
DIAL_F_INDICATOR_LINE	Set bit for line dial indicator style

Returns **nothing**

Description Draw a Dial as defined by DialDef (if required), using DialRam positioning at position value.

Example

```

var frame;
var Knob1Ram[10];

#DATA
word Knob1Info 10, 10, 152, 129, 87, 80, 38, 135, 405, 0, 100, 0x0,
0x52AA, 5, 0xB5B6, 0x3186, 200, 300, 0x280, 0x528A, 0x5800, 0x7E0, 0xFFE0,
0xF800, 12, 3, 6, 0xF800, 3, 30, 0xFFFF, FONT2, 22, 10, Labels, FONT2,
0xFFFF, -15, 50, Knob1Caption, (0 + DIAL_F_HANDLE_CIRCLE +
DIAL_F_INDICATOR_LINE)

byte Labels      "Text1\0Text2\0Text3\0Text4\0Text5\0"
byte Knob1Caption "KNOB\0"
#END

func main()
    gfx_Dial(frame, Knob1Ram, Knob1Info); // Dial Internal Widget
repeat forever
endfunc

```

2.8.55 gfx_AngularMeter(value, &MeterRam, &MeterDef)

Syntax	gfx_AngularMeter(value, &MeterRam, &MeterDef)	
Arguments	value, &MeterRam, &MeterDef	
	value	A value (usually a constant) specifying the current frame of the widget
	&MeterRam	A pointer to a variable array for widget utilization
	&MeterDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

```
#DATA
word Gauge1Info
    //Scale parameters
        90,          // Range scale outer edge radius
        70,          // Range scale inner edge radius
        20,          // Number of partitions of marker ticks
        2,           // Number of minor ticks before next major tick (0 to disable)
        17,          // Length for major ticks radiating from scale outer edge
        5,           // Length for minor ticks radiating from scale outer edge
        10,          // Length for major ticks radiating from scale inner edge
        2,           // Length for minor ticks radiating from scale inner edge
        1,            // Tick width
        0xFFFF,       // Tick color
        270,          // Starting angle for range scale second ring section
        337,          // Starting angle for range scale third ring section
        0xDF,          // Range scale first ring section color
        0x3BF,         // Range scale second ring section color
        0xF800,        // Range scale third ring section color
        0,             // Range scale section incremental step size
        10,            // Total number of marker scale labels
        1,              // Marker scale label font style
        0xFFFF,         // Marker scale label text color
        15,             // Marker scale label offset distance (relative to range scale midpoint)
        0, /* Labels */ // Pointer to label strings (Default is numeric is set to zero (0))
        (0 + 0 + 0 + 0), // Gauge Options
        2,              // Caption
        0xFFFF,         // Caption text color
        -26,            // Caption horizontal offset from rotation centre
        56,             // Caption vertical offset from rotation centre
        Caption,         // Caption text pointer

    //Gauge parameters common to needle
        10,            // Top-Left X-position
        10,            // Top-Left Y-position
        235,           // Width
        197,           // Height
        128,           // Rotation centre X-position
        125,           // Rotation centre Y-position
        0x0,            // Background color (required for erasing needle path)
        135,           // Starting angle
        405,           // Ending angle
        0,              // Minimum value
        100,            // Maximum value
```

```

// Needle parameters
60,                                // Needle length
NEEDLE_F_TRIANGLE,                  // Needle style options
0,                                   // Needle offset distance from center
6,                                   // Needle width (Half value of overall needle thickness)
30,                                 // Needle tail length (Applicable only for double triangle style)
0xFFFF,                             // Needle color
6,                                   // Needle Hub radius
0xFFFF,                             // Needle Hub color
2,                                   // Needle Pin radius
0xF800,                            // Needle Pin color

byte Caption "Caption\0"           // Caption string (Use null terminator "\0" to end string)
byte Labels  "Text1\0Text2\0Text3\0Text4\0Text5\0" // Label text strings (Use null terminator "\0" as separators)

#END

```

Widget Parameter Data Block Option Bits

ANGULAR_F_LABEL_STRINGS	Set bit for swapping gauge direction
ANGULAR_F_BG_TRANSPARENT	Set bit for toggling background transparency
ANGULAR_F_TICK_PCT_COLOUR	Set bit for replacing tick color with range scale section colors
ANGULAR_F_TEXT_PCT_COLOUR	Set bit for replacing marker label color with range scale section colors

Note: The angular meter function will require the gfx_Needle in order to function.

Returns	nothing
---------	---------

Description	Draw an angular meter as defined by MeterDef (if required), using MeterRam positioning at position value.
-------------	---

Example	<pre> var state; var Gauge1Ram[10]; #DATA word Gauge1Info 90, 70, 20, 2, 17, 5, 10, 2, 1, 0xFFFF, 270, 337, 0xDF, 0x3BF, 0xF800, 0, 10, FONT1, 0xFFFF, 15, 0, (0 + 0 + 0 + 0), FONT2, 0xFFFF, -26, 56, Gauge1Caption, 10, 10, 235, 197, 128, 125, 0x0, 135, 405, 0, 100, 60, NEEDLE_F_TRIANGLE, 0, 6, 30, 0xFFFF, 6, 0xFFFF, 2, 0xF800 byte Gauge1Caption "Caption\0" #END func main() gfx_AngularMeter(state, Gauge1Ram, Gauge1Info); // Gauge repeat forever endfunc </pre>
---------	--

2.8.56 gfx_Needle(value, &NeedleRam, &NeedleDef)

Syntax	gfx_Needle(value, &NeedleRam, &NeedleDef)	
Arguments	value, &NeedleRam, &NeedleDef	
	value	A value (usually a constant) specifying the current frame of the widget
	&NeedleRam	A pointer to a variable array for widget utilization
	&NeedleDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

```
#DATA
word NeedleInfo    10,           // Top-Left X-position
                  10,           // Top-Left Y-position
                  235,          // Width
                  197,          // Height
                  128,          // Rotation centre X-position
                  125,          // Rotation centre Y-position
                  0x0,           // Background color (required for erasing needle path)
                  135,           // Starting angle
                  405,           // Ending angle
                  0,             // Minimum value
                  100,           // Maximum value
                  60,            // Needle length
                  NEEDLE_F_LINE, // Needle style options
                  0,             // Needle offset distance from center
                  6,              // Needle width (Half value of overall needle thickness)
                  30,             // Needle tail length (Applicable only for DoubleTriangle style)
                  0xFFFF,         // Needle color
                  6,              // Needle Hub radius
                  0xFFFF,         // Needle Hub color
                  2,              // Needle Pin radius
                  0xF800,         // Needle Pin color
#END
```

Needle Style Options

NEEDLE_F_LINE	Line needle pointer
NEEDLE_F_RECTANGLE	Rectangular needle pointer
NEEDLE_F_POINTRECTANGLE	Pointed rectangular needle pointer
NEEDLE_F_TRIANGLE	Triangular needle pointer
NEEDLE_F_DOUBLETRIANGLE	Double ended triangular needle pointer
NEEDLE_F_ROUNDEDRECTANGLE	Rounded corner rectangular needle pointer

Note: The needle function can be used standalone without the angular meter function, but the angular meter function will require the needle function.

Returns	nothing
Description	Draw a Needle as defined by NeedleDef (if required), using NeedleRam positioning at position value.
Example	<pre>var frame; var NeedleRam[10];</pre>

```
#DATA
word NeedleInfo  10, 10, 235, 197, 128, 125, 0x0, 135, 405, 0, 100, 60,
NEEDLE_F_TRIANGLE, 0, 6, 30, 0xFFFF, 6, 0xFFFF, 2, 0xF800
#END
func main()
    gfx_Needle(frame, NeedleRam, NeedleInfo); // Rotating Needle
    repeat forever
endfunc
```

2.8.57 gfx_Gauge(value, &GaugeRam, &GaugeDef)

Syntax	gfx_Gauge(value, &GaugeRam, &GaugeDef)	
Arguments	value, &GaugeRam, &GaugeDef	
	value	A value (usually a constant) specifying the current frame of the widget
	&GaugeRam	A pointer to a variable array for widget utilization
	&GaugeDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

```
#DATA
word Gauge1Info 10,           // Top-Left X-position
      10,           // Top-Left Y-position
      181,          // Gauge length
      59,           // Gauge width
      11,           // Number of Gauge bars
      0,            // Minimum gauge value
      100,          // Maximum gauge value
      10,           // Bar thickness
      5,            // Bar spacing
      0x18E3,        // Inter 'bar' gap color
      0x280,         // Partition 1 low colour
      0x7E0,         // Partition 1 active colour
      0x5280,        // Partition 2 low colour
      0xFFE0,        // Partition 2 active colour
      0xA000,        // Partition 3 low colour
      0xF800,        // Partition 3 active colour
      8,             // Partition 2 starting bar
      5,             // Partition 3 starting bar
      (0)            // Gauge Option bits
#END
```

Widget Parameter Data Block Option Bits

GAUGE_F_TOPRIGHT Set bit for swapping gauge direction to start from top or right side
GAUGE_F_HORZ Horizontal orientation set bit (Default is Vertical)

Note: For optimal appearance, calculate number of bars for given height first using this formula:

bars = ((gauge height / 2) + (spacing / 2) + 1) / ((bar thickness / 2) + (spacing / 2) + 2)

then calculate exact height given the calculated ticks:

height = bars * ((bar thickness / 2) + (spacing / 2) +2) - (spacing / 2) - 1

Returns	nothing
Description	Draw a Gauge as defined by GaugeDef (if required), using GaugeRam positioning at position value.
Example	<pre>var frame; var Gauge1Ram[10]; #DATA word Gauge1Info 10, 10, 181, 59, 11, 0, 100, 10, 5, 0x18E3, 0x280, 0x7E0, 0x5280, 0xFFE0, 0xA000, 0xF800, 8, 5, (GAUGE_F_HORZ + GAUGE_F_TOPRIGHT) #END</pre>

```
func main()
    gfx_Gauge(frame, Gauge1Ram, Gauge1Info); // Gauge Internal Widget
repeat forever
endfunc
```

2.8.58 gfx_RulerGauge(value, &RulerGaugeRam, &RulerGaugeDef)

Syntax	<code>gfx_RulerGauge(value, &RulerGaugeRam, &RulerGaugeDef)</code>				
Arguments	value, &ram, &def				
	value A value (usually a constant) specifying the current frame of the widget				
	&RulerGaugeRam A pointer to a variable array for widget utilization				
	&RulerGaugeDef A pointer to the Data Block holding the widget parameters				
Flash Data Block Format					
#DATA					
<code>word Gauge1Info 10, // Top-Left X-position 10, // Top-Left Y-position 250, // Widget length 52, // Widget width 100, // Widget total frames 6, // Number of partitions between each major ticks 5, // Number of minor tick partitions between each major ticks 10, // Minor tick length 20, // Major tick length 50, // Starting frame for medium range scale 75, // Starting frame for high range scale 0x3A08, // Base color 0x1F, // Low range color 0xFD20, // Medium range color 0xF800, // High range color 0xFFFF, // Marker tick color RULERGAUGE_TICKS_BOTTOM // Option bits (See Flash Data Block Option Bits)</code>					
#END					
Flash Data Block Option Bits					
<table> <tr> <td>RULERGAUGE_TICKS_TOP</td> <td>Set bit for setting marker tick location at the top of the gauge</td> </tr> <tr> <td>RULERGAUGE_TICKS_BOTTOM</td> <td>Set bit for setting marker tick location at the bottom of the gauge</td> </tr> </table>		RULERGAUGE_TICKS_TOP	Set bit for setting marker tick location at the top of the gauge	RULERGAUGE_TICKS_BOTTOM	Set bit for setting marker tick location at the bottom of the gauge
RULERGAUGE_TICKS_TOP	Set bit for setting marker tick location at the top of the gauge				
RULERGAUGE_TICKS_BOTTOM	Set bit for setting marker tick location at the bottom of the gauge				
Returns	nothing				
Description	Draw a RulerGauge as defined by RulerGaugeDef (if required), using RulerGaugeRam positioning at position value. See the reference for the RulerGaugeDef values.				
Example	<pre>var value; var Gauge1Ram[10]; #DATA word Gauge1Info 10, 10, 250, 52, 100, 6, 5, 10, 20, 50, 75, 0x3A08, 0x1F, 0xFD20, 0xF800, 0xFFFF, RULERGAUGE_TICKS_BOTTOM #END func main() gfx_RulerGauge(value, Gauge1Ram, Gauge1Info); // Gauge Internal Widget repeat forever endfunc</pre>				

2.8.59 gfx_Led(state, &LedRam, &LedDef)

Syntax	<code>gfx_Led(state, &LedRam, &LedDef)</code>						
Arguments	state, &LedRam, &LedDef						
	<table> <tr> <td>state</td><td>A value (usually a constant) specifying the current frame of the widget</td></tr> <tr> <td>&LedRam</td><td>A pointer to a variable array for widget utilization</td></tr> <tr> <td>&LedDef</td><td>A pointer to the Data Block holding the widget parameters</td></tr> </table>	state	A value (usually a constant) specifying the current frame of the widget	&LedRam	A pointer to a variable array for widget utilization	&LedDef	A pointer to the Data Block holding the widget parameters
state	A value (usually a constant) specifying the current frame of the widget						
&LedRam	A pointer to a variable array for widget utilization						
&LedDef	A pointer to the Data Block holding the widget parameters						
Widget Parameter Data Block Format							
#DATA							
<pre>word Led1Info 10, // Top-Left X-position 10, // Top-Left Y-position 113, // Widget width 96, // Widget height 0x2965, // Base gradient color 1 0x0, // Base gradient color 2 0xDEFB, // LED shine effect color 0xF800, // LED color (State 1) 0x5800, // LED color (State 0) 35, // Base bevel inner radius 40, // Base bevel outer radius 20, // LED Shine effect radius 30, // Outer LED radius 1 // LED Shine effect (1 - enable, 0 - disable)</pre>							
#END							
Returns	nothing						
Description	Draw a Led as defined by LedDef (if required), using LedRam positioning in state state. See the reference for the LedDef values.						
Example	<pre>var state; var Led1Ram[10]; #DATA word Led1Info 10, 10, 113, 96, 0x2965, 0x0, 0xFFFF, 0xF800, 0x5800, 35, 40, 20, 30, 1 #END func main() gfx_Led(state, Led1Ram, Led1Info); // LED Internal Widget repeat forever endfunc</pre>						

2.8.60 gfx_LedDigits(value, &LedDigitRam, &LedDigitDef)

Syntax	<code>gfx_LedDigits(value, &LedDigitRam, &LedDigitDef)</code>	
Arguments	value, &LedDigitRam, &LedDigitDef	
	value	For the int16 format, a value specifying the current frame of the widget. For other formats (Int32 and Float) are both 32-bits therefore value is the address of a two element array containing the value.
	&LedDigitRam	A pointer to a variable array for widget utilization
	&LedDigitDef	A pointer to the Data Block holding the widget parameters

Widget Parameter Data Block Format Example

```
#DATA
word Digits1Info    10,                      // Top-Left X-position
                  10,                      // Top-Left Y-position
                  66,                      // Widget width (Used only for touch region)
                  106,                     // Widget height (Used only for touch region)
                  2,                       // Number of digits
                  0,                       // Separator placement (To disable separator use -1)
                  0,                       // Spacing distance between each digits
                  5,                       // Digit size
                  0xFFFF,                  // LED segment ON color
                  0x630C,                  // LED segment OFF color
                  (0 + 0 + 0)              // Option bits (See Widget Parameter Data Block Option Bits)
#END
```

Widget Parameter Data Block Option Bits

LEDDIGITS_F_GENERAL	Set bit for LED digit general format
LEDDIGITS_F_FIXED	Set bit for LED digit fixed format
LEDDIGITS_F_SCIENTIFIC	Set bit for LED digit scientific format
LEDDIGITS_F_INT16	Set bit for 16-bit Integer LED digit format
LEDDIGITS_F_INT32	Set bit for 32-bit Integer LED digit format
LEDDIGITS_F_FLOAT	Set bit for Float LED digit format
LEDDIGITS_F_UNSIGNED	Set bit for unsigned LED digit format
LEDDIGITS_F_SIGNED	Set bit for signed LED digit format
LEDDIGITS_F.LEADING0	Set bit for setting leading digits as zeroes
LEDDIGITS_F.LEADINGb	Set bit for setting leading digits as blanks
LEDDIGITS_F_DP_DOT	Set bit for using dots as separator
LEDDIGITS_F_DP_COMMAS	Set bit for using commas as separator

Returns	nothing
---------	----------------

Description	Draw a series of 7 segment Led Digits as defined by LedDigitDef, using LedDigitRam positioning at position value.
-------------	---

Example	<pre>var value; var Digits1RAM [12]; #DATA word Digits1Info 10, 10, 66, 106, 2, 0, 0, 5, 0xFFFF, 0x630C,(LEDDIGITS_F.LEADING0 LEDDIGITS_F_UNSIGNED LEDDIGITS_F_INT16 LEDDIGITS_F_DP_DOT)</pre>
---------	---

```
#END  
func main()  
    gfx_LedDigits (value, Digits1RAM, Digits1Info); // LED digit Widget  
repeat forever  
endfunc
```

2.8.61 gfx_LedDigit(x, y, digitsize, oncolour, offcolour, value)

Syntax	<code>gfx_LedDigit(x, y, digitsize, oncolour, offcolour, value);</code>
Arguments	x, y, digitsize, oncolour, offcolour, value
	x, y x- and y-coordinates of position
	digitsize Size of digit
	oncolour Color when status is on
	offcolour Color when status is off
	value Value to show
Returns	nothing
Description	Draws a single 7 segment led Digit at x, y of size digitsize using oncolour and offcolour. The value can be 0-9 (0-9), A-F (0x0a-0x0f), blank(0x10) and - (0x11). Or value with LEDDIGIT_F_SHOW_DP to show a decimal point, LEDDIGIT_F_DP_COMMAS to make the Decimal point a comma and LEDDIGIT_F_DP_ON to turn the decimal point on LEDDIGIT_F_SET_SEGMENTS can be used to turn value into a series of bits to turn on individual segments eg LEDDIGIT_F_SET_SEGMENTS + 9 will turn on the top and bottom segments. Again LEDDIGIT_F_SHOW_DP and LEDDIGIT_F_DP_COMMAS can be used, but in this case the DP is the 8th segment.
Example	<code>gfx_LedDigit(10, 10, 5, YELLOW, LIME, 3);</code>

2.8.62 gfx_Scale(&ScaleRam, &ScaleDef)

Syntax	gfx_Scale(&ScaleRam, &ScaleDef)	
Arguments	&ScaleRam, &ScaleDef	
	&ScaleRam	A pointer to a variable array for widget utilization
	&ScaleDef	A pointer to the Data Block holding the widget parameters
Widget Parameter Data Block Format		
#DATA	<pre>word Image1Info 36, // Top-Left X-position 10, // Top-Left Y-position 197, // Length 0, // Minimum value 100, // Maximum value 5, // Major tick partitions 10, // Major tick length 2, // Number of minor ticks inside each partition 5, // Minor tick length 0xFFFF, // Tick color 0x0, // Marker text background color 0xFFFF, // Marker text color 3, // Marker text font style 0, // Gap size for centred marker text to ticks (0 + 0 + 0) // Option bits (See Widget Parameter Data Block Option Bits)</pre>	
#END		
Widget Parameter Data Block Option Bits		
SCALE_TL	Set bit to align marker scale position to Top/Left side of the axis	
SCALE_BR	Set bit to align marker scale position to Bottom/Right side of the axis	
SCALE_CENTRE	Set bit to align marker scale position to Centre of the axis	
SCALE_NONE	Set bit to disable marker scale	
SCALE_TICKS_TL	Set bit to project marker ticks to Top/Left side of the axis	
SCALE_TICKS_BR	Set bit to project marker ticks to Bottom/Right side of the axis	
SCALE_TICKS_BOTH	Set bit to project marker ticks on both side of the axis	
SCALE_TICKS_NONE	Set bit to disable marker ticks	
SCALE_VERT	Set bit for scale vertical orientation	
SCALE_HORZ	Set bit for scale horizontal orientation	
SCALE_END_ALIGN	Set bit for aligning the end markers to the last marker ticks	
SCALE_NO_END_ALIGN	Set bit for removing end alignment	
SCALE_SHOW_ZERO	Set bit for showing zero digit in the marker scale	
SCALE_HIDE_ZERO	Set bit for hiding zero digit in the marker scale	
Returns	nothing	
Description	Draw a Scale as defined by ScaleDef, setting LedRam for use in touch processing. See the reference for the ScaleDef values. If touch processing is not required 0 may be used as the ScaleRam parameter.	
Example	<pre>var ImageRAM1[10];</pre> <pre>#DATA</pre>	

```
word Image1Info 36, 10, 197, 0, 100, 5, 10, 2, 5, 0xFFFF, 0x0, 0xFFFF,  
FONT3, 0, (SCALE_CENTRE | SCALE_TICKS_BOTH | SCALE_VERT | SCALE_END_ALIGN |  
SCALE_SHOW_ZERO)  
  
#END  
  
func main()  
    gfx_Scale(ImageRAM1, Image1Info); // Scale object  
repeat forever  
endfunc
```

2.8.63 gfx_Panel(state, x, y, Width, Height, Colour)

Syntax	<code>gfx_Panel(state, x, y, Width, Height, Colour);</code>
Arguments	state, x, y, buttonColour, txtColour, font, txtWidth, txtHeight, text
	state 0 = recessed; 1 = raised.
	x, y Specifies the top left corner position of the panel on the screen.
	Width Specifies the width of the panel.
	Height Specifies the Height of the panel.
	Colour Specifies the colour of the panel.
Returns	nothing
Description	Draws a 3 dimensional rectangular panel at a screen location defined by x, y parameters (top left corner). The size of the panel is set with the width and height parameters. The colour is defined by colour The state parameter determines the appearance of the panel, 0 = recessed, 1 = raised.
Example	#constant LEFT 15 #constant TOP 15 #constant WIDTH 100 #constant HEIGHT 100 func main() // Draw a panel gfx_Panel(RAISED, LEFT, TOP, WIDTH, HEIGHT, GRAY); repeat forever endfunc

2.8.64 gfx_Panel2(state, x, y, width, height, w1, w2, cl, cr)

Syntax	<code>gfx_Panel2(state, x, y, width, height, w1, w2, cl, cr)</code>																		
Arguments	state, x, y, width, height, w1, w2, cl, cr																		
	<table border="1"> <tbody> <tr> <td>state</td><td>Bevel direction (0 – Inwards, 1 – Outwards) Additional bit for filling panel with fill color (0x8000 - PANEL2_FILLED)</td></tr> <tr> <td>x, y</td><td>Top-Left X-position, Top-Left Y-position</td></tr> <tr> <td>width</td><td>Panel width</td></tr> <tr> <td>height</td><td>Panel height</td></tr> <tr> <td>w1</td><td>Outer bevel offset</td></tr> <tr> <td>w2</td><td>Inner bevel offset</td></tr> <tr> <td>cl</td><td>Main bevel color</td></tr> <tr> <td>cr</td><td>Shadow bevel color</td></tr> <tr> <td>cf</td><td>Panel fill color</td></tr> </tbody> </table>	state	Bevel direction (0 – Inwards, 1 – Outwards) Additional bit for filling panel with fill color (0x8000 - PANEL2_FILLED)	x, y	Top-Left X-position, Top-Left Y-position	width	Panel width	height	Panel height	w1	Outer bevel offset	w2	Inner bevel offset	cl	Main bevel color	cr	Shadow bevel color	cf	Panel fill color
state	Bevel direction (0 – Inwards, 1 – Outwards) Additional bit for filling panel with fill color (0x8000 - PANEL2_FILLED)																		
x, y	Top-Left X-position, Top-Left Y-position																		
width	Panel width																		
height	Panel height																		
w1	Outer bevel offset																		
w2	Inner bevel offset																		
cl	Main bevel color																		
cr	Shadow bevel color																		
cf	Panel fill color																		
Returns	nothing																		
Description	Draws a panel2 (groupbox) at screen location defined by x, y, width and height with left colour "cl" and right colour "cr". w1 and w2 define the width of the outer and inner borders. state = 0 : recessed state = 1 : raised state + PANEL2_FILLED : draws with fill color "cf"																		
Example	<pre>func main() gfx_Panel2(1, 10, 10, 77, 81, 5, 5, 0xFFFF, 0x528A, 0x8800); // Panel object repeat forever endfunc</pre>																		

2.8.65 gfx_GradientShape(GradientRAM, HorzVert, OuterWidth, X, Y, W, H, TLrad, TRrad, BLrad, BRrad, Darken, OuterColor, OuterType, OuterLevel, InnerColor, InnerType, InnerLevel, Split)

Syntax	gfx_GradientShape(GradientRAM, HorzVert, OuterWidth, X, Y, W, H, TLrad, TRrad, BLrad, BRrad, Darken, OuterColor, OuterType, OuterLevel, InnerColor, InnerType, InnerLevel, Split)	
Arguments	GradientRAM , HorzVert , OuterWidth , X , Y , W , H , TLrad , TRrad , BLrad , BRrad , Darken , OuterColor , OuterType , OuterLevel , InnerColor , InnerType , InnerLevel , Split	
	GradientRAM	This Function requires a quantity or RAM to work. It also needs to be initialised and it's size varies according to the largest corner radius. Multiple gradient shape calls can share the same GradientRAM. eg gradientRAM[29+91*2] := [-1,-1,-9999,0,0,91] ; Would support a maximum radius of 90 degrees, note the 91 in two places.
	HorzVert	Horizontal or Vertical -- 0 or 1
	OuterWidth	Outer gradient width
	X	x co-ordinate
	Y	y co-ordinate
	W	Width
	H	Height
	TLrad	Top left corner radius
	TRrad	Top right corner radius
	BLrad	Bottom left radius
	BRrad	Bottom right radius
	Darken	Darken both colours by a value. Can be a -ve value to lighten
	OuterColor	Outer Gradient colour
	OuterType	Outer Gradient type (0 - 3 horizontal, +4 vertical) 0 - Raised 1 - Sunken 2 - Raised flatter middle 3 - Sunken flatter middle
	OuterLevel	Outer Gradient level 0 - 63
	InnerColor	Inner Gradient colour
	InnerType	Outer Gradient type (0 - 3 horizontal, +4 vertical) 0 - Raised 1 - Sunken 2 - Raised flatter middle 3 - Sunken flatter middle
	InnerLevel	Inner Gradient level 0 - 63
	Split	Split gradient 0 - no split 1 - top 2 - bottom

Returns	nothing
Description	Produce a shaped color gradient using the supplied parameters Note: This function is only available in Flash PmmCs
Example	<code>gfx_GradientShape(GradientRAM, HorzVert, OuterWidth, X, Y, W, H, TLrad, TRrad, BLrad, BRrad, Darken, OuterColor, OuterType, OuterLevel, InnerColor, InnerType, InnerLevel, Split) ;</code>

2.8.66 gfx_GradientColor (Type, Darken, Level, H, Pos, Color)

Syntax	<code>gfx_GradientColor(Type, Darken, Level, H, Pos, Color)</code>
Arguments	Type, Darken, Level, H, Pos, Color
	Type Gradient type (0 - 3 horizontal, +4 vertical) 0 – Raised 1 – Sunken 2 - Raised flatter middle 3 - Sunken flatter middle
	Darken Darken colour by a value. Can be a -ve value to lighten
	Level Gradient level 0 - 63
	H Height of the object that gradient is applied
	Pos Position in the height that gradient is calculated
	Color Source colour that gradient is applied to
Returns	Color after Adjustment.
Description	Given the parameters, adjust the input color to produce the output color. Note: This function is only available in Flash PmmCs
Example	<code>gfx_GradientColor(Type, Darken, Level, H, Pos, Color)</code>

2.8.67 gfx_GradTriangleFilled(X0, Y0, X1, Y1, X2, Y2, SolidCol, GradientCol, GradientHeight, GradientY, GradientLevel, Type)

Syntax	<code>gfx_GradTriangleFilled(X0, Y0, X1, Y1, X2, Y2, SolidCol, GradientCol, GradientHeight, GradientY, GradientLevel, Type)</code>
Arguments	X0, Y0, X1, Y1, X2, Y2, SolidCol, GradientCol, GradientHeight, GradientY, GradientLevel, Type
	X0 First triangle point x coordinate
	Y0 First triangle point y coordinate
	X1 Second triangle point x coordinate
	Y1 Second triangle point y coordinate
	X2 Third triangle point x coordinate
	Y2 Third triangle point y coordinate
	SolidCol Colour that will be used if the Solid or Gradient parameter is set to 0
	GradientCol Colour that will be used if the Solid or Gradient parameter is set to 1
	GradientHeight Height of the area that the gradient will be calculated. Can be larger than the triangle
	GradientY Position on the Y axis that the gradient will be calculated from with respect to triangle position
	GradientLevel Level of gradient applied
	Type Select whether solid triangle or gradient triangle is drawn.
Returns	nothing
Description	Produce a triangle with or without a gradient. Note: This function is only available in Flash PmmCs
Example	<code>gfx_GradTriangleFilled(10, 10, 10, 100, 100, 100, YELLOW, DARKKHAKI, 100, 10, 30, 1);</code>

2.9. I2C BUS Master Functions

Summary of functions in this section:

- I2C1_Open(Speed) or I2C2_Open(Speed) or I2C3_Open(Speed)
- I2C1_Close() or I2C2_Close() or I2C3_Close()
- I2C1_Start() or I2C2_Start() or I2C3_Start()
- I2C1_Stop() or I2C2_Stop() or I2C3_Stop
- I2C1_Restart() or I2C2_Restart() or I2C3_Restart()
- I2C1_Read() or I2C2_Read() or I2C3_Read()|I2C1_Stop() or I2C2_Stop() or I2C3_Stop()
- I2C1_Write(byte) or I2C2_Write(byte) or I2C3_Write(byte)
- I2C1_Ack() or I2C2_Ack() or I2C3_Ack()
- I2C1_Nack() or I2C2_Nack() or I2C3_Nack()
- I2C1_AckStatus() or I2C2_AckStatus() or I2C3_AckStatus()
- I2C1_AckPoll(control) or I2C2_AckPoll(control) or I2C3_AckPoll(control)
- I2C1_Idle() or I2C2_Idle() or I2C3_Idle()
- I2C1_Gets(buffer, size) or I2C2_Gets(buffer, size) or I2C3_Gets(buffer, size)
- I2C1_Getn(buffer, count) or I2C2_Getn(buffer, count) or I2C3_Getn(buffer, count)
- I2C1_Puts(buffer) or I2C2_Puts(buffer) or I2C3_Puts(buffer)
- I2C1_Putn(buffer, count) or I2C2_Putn(buffer, count) or I2C3_Putn(buffer, count)

2.9.1 I2C1_Open(Speed) or I2C2_Open(Speed) or I2C3_Open(Speed)

Syntax	I2C1_Open(Speed); or I2C2_Open(Speed); or I2C3_Open(Speed);
Arguments	Speed
	Speed Specifies the I2C bus speed Speed can be I2C_SLOW, I2C_MED, I2C_FAST (100khz, 400khz, 1mhz) The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Calling this function configures the I2C module and initialises it to be ready for service. The I2C clock speed is specified by the speed parameter. Three I2C Speed settings are available to suit various requirements. Constant Speed I2C_SLOW 100khz I2C_MED 400khz I2C_FAST 1mhz
Example	I2C1_Open(I2C_MED); // Open the I2C1 port in 400KHz mode.

2.9.2 I2C1_Close() or I2C2_Close() or I2C3_Close()

Syntax	I2C1_Close(); or I2C2_Close(); or I2C3_Close();
Arguments	none
Returns	nothing
Description	Calling this function closes the I2C port and disables the I2C hardware
Example	I2C1_Close(); // Close I2C1 port and Disable the hardware

2.9.3 I2C1_Start() or I2C2_Start() or I2C3_Start()

Syntax	I2C1_Start(); or I2C2_Start(); or I2C3_Start();																								
Arguments	none																								
Returns	nothing																								
Description	<p>Calling this function sends an I2C start condition. The hardware first pulls the SDA (data) line low, and next pulls the SCL (clock) line low.</p> <p>SCL └─── SDA └───</p> <table border="1"><thead><tr><th>I2C Bus</th><th>PIXXI-28 Pin Number</th><th>PIXXI-44 Pin Number</th></tr></thead><tbody><tr><td rowspan="2">I2C1</td><td>SCL1</td><td>1</td><td>38</td></tr><tr><td>SDA1</td><td>2</td><td>37</td></tr><tr><td rowspan="2">I2C2</td><td>SCL2</td><td>NA</td><td>25</td></tr><tr><td>SDA2</td><td>NA</td><td>27</td></tr><tr><td rowspan="2">I2C3</td><td>SCL3</td><td>3</td><td>19</td></tr><tr><td>SDA3</td><td>12</td><td>42</td></tr></tbody></table> <p>Note: I2C3 is usually used by the display touch panel</p>	I2C Bus	PIXXI-28 Pin Number	PIXXI-44 Pin Number	I2C1	SCL1	1	38	SDA1	2	37	I2C2	SCL2	NA	25	SDA2	NA	27	I2C3	SCL3	3	19	SDA3	12	42
I2C Bus	PIXXI-28 Pin Number	PIXXI-44 Pin Number																							
I2C1	SCL1	1	38																						
	SDA1	2	37																						
I2C2	SCL2	NA	25																						
	SDA2	NA	27																						
I2C3	SCL3	3	19																						
	SDA3	12	42																						
Example	I2C1_Start(); //Send an I2C start condition.																								

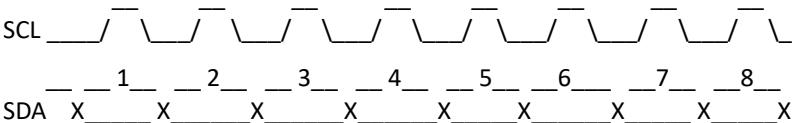

2.9.4 I2C1_Stop() or I2C2_Stop() or I2C3_Stop()

Syntax	I2C1_Stop(); or I2C2_Stop(); or I2C3_Stop();
Arguments	none
Returns	nothing
Description	Calling this function sends an I2C stop condition. The hardware first releases the SCL to high state, and then releases the SDA line high. SCL _____/ SDA _____/
Example	I2C1_stop(); //Send an I2C stop condition

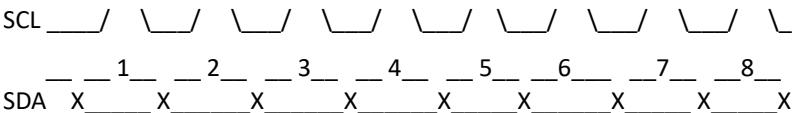

2.9.5 I2C1_Restart() or I2C2_Restart() or I2C3_Restart()

Syntax	I2C1_Restart(); or I2C2_Restart(); or I2C3_Restart();
Arguments	none
Returns	nothing
Description	Calling this function generates a restart condition.
Example	I2C1_Restart(); //Generates an I2C restart condition

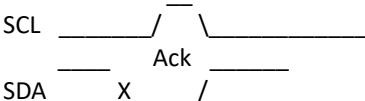

2.9.6 I2C1_Read() or I2C2_Read() or I2C3_Read()

Syntax	I2C1_Read(); I2C2_Read(); I2C3_Read();
Arguments	none
Returns	byte byte Byte from the I2C Bus in the lower 8 bits.
Description	Calling this function reads a single byte from the I2C bus. Note: Data can only change when the clock is low.  SCL 1 2 3 4 5 6 7 8 SDA X X X X X X X X
Example	c := I2C1_Read(); //Read a single byte from the I2C1 Bus

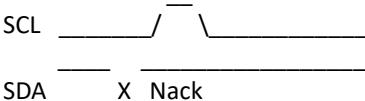

2.9.7 I2C1_Write(byte) or I2C2_Write(byte) or I2C3_Write(byte)

Syntax	I2C1_Write(byte); or I2C2_Write(byte); or I2C3_Write(byte);	
Arguments	byte	
	byte	The byte to be written to the I2C Bus. The arguments can be a variable, array element, expression or constant
Returns	Status	
	Status	Returns 0 if False/Fail Returns 1 if Success/OK Returns 2 if NAK from device (or device does not exist)
Description	Calling this function sends a single byte to the I2C bus 	
Example	<code>Status := I2C1_Write(bytewhite); // Send a single byte to the I2C</code>	

2.9.8 I2C1_Ack() or I2C2_Ack() or I2C3_Ack()

Syntax	I2C1_Ack(); or I2C2_Ack(); or I2C3_Ack();
Arguments	none
Returns	nothing
Description	<p>Calling this function sends an I2C acknowledge condition. The hardware first pulls the SDA line low, and next releases SCL high followed by pulling SCL low again thus generating a clock pulse, SDA is then released high.</p> <p>NB:- Data can only change when the clock is low.</p> 
Example	I2C1_Ack(); // Send I2C Acknowledge condition

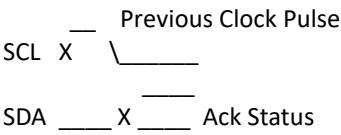

2.9.9 I2C1_Nack() or I2C2_Nack() or I2C3_Nack()

Syntax	I2C1_Nack(); or I2C2_Nack(); or I2C3_Nack();
Arguments	none
Returns	nothing
Description	<p>Calling this function sends an I2C negative acknowledge condition. The hardware first releases the SDA line high, and next releases SCL HI followed by pulling SCL low thus generating a clock pulse.</p> <p>NB:- Data can only change when the clock is low.</p>  <p>SCL _____ / \ _____ SDA _____ X Nack</p>
Example	I2C1_Nack(); //Send an I2C Negative acknowledge condition

2.9.10 I2C1_AckStatus() or I2C2_AckStatus() or I2C3_AckStatus()

Syntax	I2C1_AckStatus(); or I2C2_AckStatus(); or I2C3_AckStatus();
Arguments	none
Returns	Status
	Status Device Ack status
Description	<p>Call this function to get the ACK status from the slave device The state of SDA is returned.</p> <p>NB:- returns the state of SDA after the last clock pulse</p> <p style="text-align: center;">Previous Clock Pulse SCL X _____ SDA ____ X ____ Ack Status</p>
Example	r := I2C1_AckStatus(); // returns the Ack Status.

2.9.11 I2C1_AckPoll(control) or I2C2_AckPoll(control) or I2C3_AckPoll(control)

Syntax	I2C1_AckPoll(control); or I2C2_AckPoll(control); or I2C3_AckPoll(control);	
Arguments	control	
	control	The control word to be written to the device. The arguments can be a variable, array element, expression or constant
Returns	Status	
	Status	Device Ack Status
Description	Call this function to wait for a device to return an ACK during ACK polling The SDA is monitored for an Ack. NB:- returns the state of SDA after the last clock pulse 	
Example	<pre>r := I2C1_AckPoll(0xA0); //send the control byte the wait for a device //to return poll the device until an ACK //is received.</pre>	

2.9.12 I2C1_Idle() or I2C2_Idle() or I2C3_Idle()

Syntax	I2C1_Idle(); or I2C2_Idle(); or I2C3_Idle();
Arguments	none
Returns	Status
	Status Device Ack Status
Description	Call this function to wait until the I2C bus is inactive. NB:- wait for the bus to become idle. SCL X ____ X / ____ SDA X ____ X / ____
Example	r := I2C1_Idle(); //Wait until the I2C1 Bus is inactive.

2.9.13 I2C1_Gets(buffer, size) or I2C2_Gets(buffer, size) or I2C3_Gets(buffer, size)

Syntax	I2C1_Gets(buffer, size); or I2C2_Gets(buffer, size); or I2C3_Gets(buffer, size);	
Arguments	buffer, size	
	buffer	Storage for the string being read from the device.
	size	Maximum size of the string to be read
Returns	count	
	count	Returns the count of bytes actually read.
Description	Reads up to size characters into buffer from an ascii string stored in a device. Reads up to the ASCII NULL terminator and includes the terminator.	
Example	<pre>c := I2C1_Gets(buf, size); //read a string from the I2C1 Bus to buffer //up to size characters.</pre>	

2.9.14 I2C1_Getn(buffer, count) or I2C2_Getn(buffer, count) or I2C3_Getn(buffer, count)

Syntax	I2C1_Getn(buffer, count); or I2C2_Getn(buffer, count); or I2C3_Getn(buffer, count);	
Arguments	buffer, count	
buffer	Storage for the bytes being read from the device.	
	count	Number of bytes to be read
The arguments can be a variable, array element, expression or constant		
Returns	status	
	status	Returns True if block read ok else returns False.
Description	Reads count bytes in to buffer and returns True if function succeeds	
Example	I2C1_Getn(buffer, count); //read I2C count bytes from the I2C1 Bus to //the buffer	

2.9.15 I2C1_Puts(buffer) or I2C2_Puts(buffer) or I2C3_Puts(buffer)

Syntax	I2C1_Puts(buffer); or I2C2_Puts(buffer); or I2C3_Puts(buffer);	
Arguments	buffer	
	buffer	Storage for the string being written to the device. The arguments can be a variable, array element, expression or constant
Returns	count	
	count	Returns the count of bytes actually written.
Description	Writes an ASCII string from buffer to a device. The ASCII NULL terminator is also written.	
Example	<code>c := I2C1_Puts(mybuf); //write an ASCII string from buffer to the I2C1 //bus</code>	

2.9.16 I2C1_Putn(buffer, count) or I2C2_Putn(buffer, count) or I2C3_Putn(buffer, count)

Syntax	I2C1_Putn(buffer, count); or I2C2_Putn(buffer, count); or I2C3_Putn(buffer, count);	
Arguments	buffer, count	
	buffer	Storage for the bytes being written to the device.
	count	Number of bytes to be written
Returns	count	
	count	Returns number of bytes written.
Description	Writes count bytes from the buffer to the device, and returns count if function succeeds.	
Example	<code>b := I2C1_Putn(mybuf, count); // write count bytes from the buffer to // the I2C1 bus.</code>	

2.10. Image Control Functions

Summary of functions in this section:

- img_SetPosition(handle, index, xpos, ypos)
- img_Enable(handle, index)
- img_Disable(handle, index)
- img_Darken(handle, index)
- img_Lighten(handle, index)
- img_SetWord(handle, index, offset, word)
- img_GetWord(handle, index, offset)
- img_Show(handle, index)
- img_SetAttributes(handle, index, value)
- img_ClearAttributes(handle, index, value)
- img_Touched(handle, index)

The following functions are Image File System for use with a SPI Flash Memory device, only available for the Flash-based PmmC.

- img_FileRead(*dest, size, handle, index)
- img_FileSeek(handle, index, HiWord, LoWord)
- img_FileIndex(handle, index, HiSize, LoSize, recordnum)
- img_FileTell(handle, index, &HiWord, &LoWord)
- img_FileSize(handle, index, &HiWord, &LoWord)
- img_FileGetC(handle, index)
- img_FileGetW(handle, index)
- img_FileGetS(*string, size, handle, index)
- img_FileRewind(handle, index)
- img_FileLoadFunction(handle, index)
- img_FileRun(handle, index, arglistptr)
- img_FileExec(handle, index, arglistptr)
- img_FilePlayWAV(handle, index)
- img_TxtFontID(handle, index)
- img_FileCheckUpdate(handle, index, options)
- img_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap)
- img_FunctionFreeCache(handle)

2.10.1 img_SetPosition(handle, index, xpos, ypos)

Syntax	<code>img_SetPosition(handle, index, xpos, ypos);</code>	
Arguments	handle, index, xpos, ypos	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
	xpos	Top left horizontal screen position where image is to be displayed.
	ypos	Top left vertical screen position where image is to be displayed.
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function. Sets the position where the image will next be displayed. You may turn off an image using <code>img_Disable()</code> so when <code>img_Show()</code> is called, the image will not be shown.</p>	
Example	<pre>// make a simple 'window' gfx_Panel(PANEL_RAISED, 0, 0, 239, 239, GRAY); img_SetPosition(hndl, BTN_EXIT, 224, 2); //set checkout box position img_Enable(hndl, BTN_EXIT); //enable checkout box</pre>	

2.10.2 img_Enable(handle, index)

Syntax	img_Enable(handle, index);	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image control has been created with the file_LoadImageControl(...); function.</p> <p>Enables a selected image in the image list. This is the default state so when img_Show() is called all the images in the list will be shown.</p> <p>To enable all of the images in the list at the same time set index to -1. To enable a selected image, use the image index number.</p>	
Example	<pre>r := img_Enable(hImageList, imagenum);</pre>	

2.10.3 img_Disable(handle, index)

Syntax	<code>img_Disable(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function.</p> <p>Disables an image in the image list. Use this function to turn off an image so that when <code>img_Show()</code> is called the selected image in the list will not be shown.</p> <p>To disable all of the images in the list at the same time set index to -1. To disable a selected image, use the image index number.</p>	
Example	<code>r := img_Disable(hImageList, imagenum);</code>	

2.10.4 img_Darken(handle, index)

Syntax	<code>img_Darken(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function.</p> <p>Darken an image in the image list. Use this function to darken an image so that when <code>img_Show()</code> is called the control will take effect.</p> <p>To darken all of the images in the list at the same time set index to -1.</p> <p>Note: This feature will take effect one time only and when <code>img_Show()</code> is called again the darkened image will revert back to normal.</p>	
Example	<code>r := img_Darken(hImageList, imagenum);</code>	

2.10.5 img_Lighten(handle, index)

Syntax	img_Lighten(handle, index);	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image control has been created with the file_LoadImageControl(...); function.</p> <p>Lighten an image in the image list. Use this function to lighten an image so that when img_Show() is called the control will take effect.</p> <p>To lighten all of the images in the list at the same time set index to -1.</p> <p>Note: This feature will take effect one time only and when img_Show() is called again the lightened image will revert back to normal.</p>	
Example	<pre>r := img_Lighten(hImageList, imagenum);</pre>	

2.10.6 img_SetWord(handle, index, offset, word)

Syntax	img_SetWord(handle, index, offset, word);																						
Arguments	handle, index																						
	handle	Pointer to the Image List.																					
	index	Index of the images in the list.																					
	offset	Offset of the required word in the image entry																					
	word	The word to be written to the entry																					
Returns	Status																						
	Status	Returns true if successful																					
Description	<p>This function requires that an image control has been created with the file_LoadImageControl(...); function.</p> <p>Set specified word in an image entry.</p> <table> <tbody> <tr><td>IMAGE_XPOS</td><td>2</td><td>WORD image location X</td></tr> <tr><td>IMAGE_YPOS</td><td>3</td><td>WORD image location Y</td></tr> <tr><td>IMAGE_FLAGS</td><td>6</td><td>WORD image flags</td></tr> <tr><td>IMAGE_DELAY</td><td>7</td><td>WORD inter frame delay</td></tr> <tr><td>IMAGE_INDEX</td><td>9</td><td>WORD current frame</td></tr> <tr><td>IMAGE_TAG</td><td>12</td><td>WORD user variable #1</td></tr> <tr><td>IMAGE_TAG2</td><td>13</td><td>WORD user variable #2</td></tr> </tbody> </table> <p>Note: Not all Constants are listed as some are Read Only.</p> <p>img_Show() will now show error box for out of range video frames. Also, if frame is set to -1, just a rectangle will be drawn in background colour to blank an image.</p>		IMAGE_XPOS	2	WORD image location X	IMAGE_YPOS	3	WORD image location Y	IMAGE_FLAGS	6	WORD image flags	IMAGE_DELAY	7	WORD inter frame delay	IMAGE_INDEX	9	WORD current frame	IMAGE_TAG	12	WORD user variable #1	IMAGE_TAG2	13	WORD user variable #2
IMAGE_XPOS	2	WORD image location X																					
IMAGE_YPOS	3	WORD image location Y																					
IMAGE_FLAGS	6	WORD image flags																					
IMAGE_DELAY	7	WORD inter frame delay																					
IMAGE_INDEX	9	WORD current frame																					
IMAGE_TAG	12	WORD user variable #1																					
IMAGE_TAG2	13	WORD user variable #2																					
Example	<pre>func cat() var private frame := 0; // start with frame 0 var private image := SPRITE_CAT; // cat image, can be changed with // cat.image := xxx var private speed := 30; img_SetWord(Ihdl, image, IMAGE_INDEX, frame++); frame := frame % img_GetWord(Ihdl, image, IMAGE_FRAMES); img_Show(Ihdl, image); sys_SetTimer(TIMER3,speed); // reset the event timer endfunc</pre>																						

2.10.7 img_GetWord(handle, index, offset)

Syntax	<code>img_GetWord(handle, index, offset);</code>																																											
Arguments	handle, index																																											
	handle	Pointer to the Image List.																																										
	index	Index of the images in the list.																																										
	offset	Offset of the required word in the image entry																																										
Returns	Value																																											
	value	Returns the image entry in the list.																																										
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function. Returns specified word from an image entry.</p> <table> <tbody> <tr><td>IMAGE_LOWORD</td><td>0</td><td>WORD image address LO</td></tr> <tr><td>IMAGE_HIWORD</td><td>1</td><td>WORD image address HI</td></tr> <tr><td>IMAGE_XPOS</td><td>2</td><td>WORD image location X</td></tr> <tr><td>IMAGE_YPOS</td><td>3</td><td>WORD image location Y</td></tr> <tr><td>IMAGE_WIDTH</td><td>4</td><td>WORD image width</td></tr> <tr><td>IMAGE_HEIGHT</td><td>5</td><td>WORD image height</td></tr> <tr><td>IMAGE_FLAGS</td><td>6</td><td>WORD image flags</td></tr> <tr><td>IMAGE_DELAY</td><td>7</td><td>WORD inter frame delay</td></tr> <tr><td>IMAGE_FRAMES</td><td>8</td><td>WORD number of frames</td></tr> <tr><td>IMAGE_INDEX</td><td>9</td><td>WORD current frame</td></tr> <tr><td>IMAGE_CLUSTER</td><td>10</td><td>WORD image start cluster pos (for FAT16 only)</td></tr> <tr><td>IMAGE_SECTOR</td><td>11</td><td>WORD image start sector in cluster pos (for FAT16 only)</td></tr> <tr><td>IMAGE_TAG</td><td>12</td><td>WORD user variable #1</td></tr> <tr><td>IMAGE_TAG2</td><td>13</td><td>WORD user variable #2</td></tr> </tbody> </table>		IMAGE_LOWORD	0	WORD image address LO	IMAGE_HIWORD	1	WORD image address HI	IMAGE_XPOS	2	WORD image location X	IMAGE_YPOS	3	WORD image location Y	IMAGE_WIDTH	4	WORD image width	IMAGE_HEIGHT	5	WORD image height	IMAGE_FLAGS	6	WORD image flags	IMAGE_DELAY	7	WORD inter frame delay	IMAGE_FRAMES	8	WORD number of frames	IMAGE_INDEX	9	WORD current frame	IMAGE_CLUSTER	10	WORD image start cluster pos (for FAT16 only)	IMAGE_SECTOR	11	WORD image start sector in cluster pos (for FAT16 only)	IMAGE_TAG	12	WORD user variable #1	IMAGE_TAG2	13	WORD user variable #2
IMAGE_LOWORD	0	WORD image address LO																																										
IMAGE_HIWORD	1	WORD image address HI																																										
IMAGE_XPOS	2	WORD image location X																																										
IMAGE_YPOS	3	WORD image location Y																																										
IMAGE_WIDTH	4	WORD image width																																										
IMAGE_HEIGHT	5	WORD image height																																										
IMAGE_FLAGS	6	WORD image flags																																										
IMAGE_DELAY	7	WORD inter frame delay																																										
IMAGE_FRAMES	8	WORD number of frames																																										
IMAGE_INDEX	9	WORD current frame																																										
IMAGE_CLUSTER	10	WORD image start cluster pos (for FAT16 only)																																										
IMAGE_SECTOR	11	WORD image start sector in cluster pos (for FAT16 only)																																										
IMAGE_TAG	12	WORD user variable #1																																										
IMAGE_TAG2	13	WORD user variable #2																																										
Example	<code>myvar := img_GetWord(hndl, 5, IMAGE_YPOS);</code>																																											

2.10.8 img_Show(handle, index)

Syntax	<code>img_Show(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns true if successful
Description	This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function. Display the image entry from the image control.	
Example	<code>img_Show(hndl, imageIndex);</code>	

2.10.9 img_SetAttributes(handle, index, value)

Syntax	<code>img_SetAttributes(handle, index, value);</code>																												
Arguments	handle, index, value																												
	handle	Pointer to the Image List.																											
	index	Index of the images in the list.																											
	value	Refers to various bits in the image control entry (see image attribute flags)																											
Returns	Status																												
	Status	Returns true if successful																											
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function.</p> <p>This function sets one or more bits in the IMAGE_FLAGS field of an image control entry.</p> <p>A '1' bit in the "value" field sets the respective bit in the IMAGE_FLAGS field of the image control entry which may be combined with the + or operators.</p> <p>Image attribute flags:</p> <table> <tbody> <tr> <td><code>I_ENABLED</code></td> <td>0x8000</td> <td>bit 15, set for image enabled</td> </tr> <tr> <td><code>I_DARKEN</code></td> <td>0x4000</td> <td>bit 14, display dimmed</td> </tr> <tr> <td><code>I_LIGHTEN</code></td> <td>0x2000</td> <td>bit 13, display bright</td> </tr> <tr> <td><code>I_TOUCHED</code></td> <td>0x1000</td> <td>bit 12, touch test result</td> </tr> <tr> <td><code>I_Y_LOCK</code></td> <td>0x0800</td> <td>bit 11, stop Y movement</td> </tr> <tr> <td><code>I_X_LOCK</code></td> <td>0x0400</td> <td>bit 10, stop X movement</td> </tr> <tr> <td><code>I_TOPMOST</code></td> <td>0x0200</td> <td>bit 9, draw on top of other images next update</td> </tr> <tr> <td><code>I_STAYONTOP</code></td> <td>0x0100</td> <td>bit 8, draw on top of other images always</td> </tr> <tr> <td><code>I_TOUCH_DISABLE</code></td> <td>0x0020</td> <td>bit 5, set to disable touch for this image, default=1 for movie, 0 for image</td> </tr> </tbody> </table>		<code>I_ENABLED</code>	0x8000	bit 15, set for image enabled	<code>I_DARKEN</code>	0x4000	bit 14, display dimmed	<code>I_LIGHTEN</code>	0x2000	bit 13, display bright	<code>I_TOUCHED</code>	0x1000	bit 12, touch test result	<code>I_Y_LOCK</code>	0x0800	bit 11, stop Y movement	<code>I_X_LOCK</code>	0x0400	bit 10, stop X movement	<code>I_TOPMOST</code>	0x0200	bit 9, draw on top of other images next update	<code>I_STAYONTOP</code>	0x0100	bit 8, draw on top of other images always	<code>I_TOUCH_DISABLE</code>	0x0020	bit 5, set to disable touch for this image, default=1 for movie, 0 for image
<code>I_ENABLED</code>	0x8000	bit 15, set for image enabled																											
<code>I_DARKEN</code>	0x4000	bit 14, display dimmed																											
<code>I_LIGHTEN</code>	0x2000	bit 13, display bright																											
<code>I_TOUCHED</code>	0x1000	bit 12, touch test result																											
<code>I_Y_LOCK</code>	0x0800	bit 11, stop Y movement																											
<code>I_X_LOCK</code>	0x0400	bit 10, stop X movement																											
<code>I_TOPMOST</code>	0x0200	bit 9, draw on top of other images next update																											
<code>I_STAYONTOP</code>	0x0100	bit 8, draw on top of other images always																											
<code>I_TOUCH_DISABLE</code>	0x0020	bit 5, set to disable touch for this image, default=1 for movie, 0 for image																											
Example	<pre>img_SetAttributes(Ihdl, ALL, I_TOUCH_DISABLE); // Disable touch in all images img_SetAttributes(Ihdl, ALL, I_Y_LOCK I_X_LOCK); // prevents movement in all images</pre>																												

2.10.10 img_ClearAttributes(handle, index, value)

Syntax	<code>img_ClearAttributes(handle, index, value);</code>																			
Arguments	handle, index, value																			
	handle	Pointer to the Image List.																		
	index	Index of the images in the list.																		
	value	A '1' bit indicates that a bit should be set and a '0' bit indicates that a bit is not altered. Note: if index is set to -1, the attribute is altered in ALL of the entries in the image list The constant ALL is set to -1 specifically for this purpose.																		
Returns	Status																			
	Status	Returns true if successful																		
Description	<p>This function requires that an image control has been created with the <code>file_LoadImageControl(...);</code> function.</p> <p>Clear various image attribute flags in an image control entry. (see image attribute flags below)</p> <p>Image attribute flags may be combined with the + or operators, eg:</p> <p>Returns TRUE if index was ok and function was successful, but the return value is usually ignored.</p> <p>Image attribute flags:</p> <table> <tbody> <tr> <td><code>I_ENABLED</code></td> <td>0x8000 bit 15, set for image enabled</td> </tr> <tr> <td><code>I_DARKEN</code></td> <td>0x4000 bit 14, display dimmed</td> </tr> <tr> <td><code>I_LIGHTEN</code></td> <td>0x2000 bit 13, display bright</td> </tr> <tr> <td><code>I_TOUCHED</code></td> <td>0x1000 bit 12, touch test result</td> </tr> <tr> <td><code>I_Y_LOCK</code></td> <td>0x0800 bit 11, stop Y movement</td> </tr> <tr> <td><code>I_X_LOCK</code></td> <td>0x0400 bit 10, stop X movement</td> </tr> <tr> <td><code>I_TOPMOST</code></td> <td>0x0200 bit 9, draw on top of other images next update</td> </tr> <tr> <td><code>I_STAYONTOP</code></td> <td>0x0100 bit 8, draw on top of other images always</td> </tr> <tr> <td><code>I_TOUCH_DISABLE</code></td> <td>0x0020 bit 5, set to disable touch for this image, default=1 for movie, 0 for image</td> </tr> </tbody> </table>		<code>I_ENABLED</code>	0x8000 bit 15, set for image enabled	<code>I_DARKEN</code>	0x4000 bit 14, display dimmed	<code>I_LIGHTEN</code>	0x2000 bit 13, display bright	<code>I_TOUCHED</code>	0x1000 bit 12, touch test result	<code>I_Y_LOCK</code>	0x0800 bit 11, stop Y movement	<code>I_X_LOCK</code>	0x0400 bit 10, stop X movement	<code>I_TOPMOST</code>	0x0200 bit 9, draw on top of other images next update	<code>I_STAYONTOP</code>	0x0100 bit 8, draw on top of other images always	<code>I_TOUCH_DISABLE</code>	0x0020 bit 5, set to disable touch for this image, default=1 for movie, 0 for image
<code>I_ENABLED</code>	0x8000 bit 15, set for image enabled																			
<code>I_DARKEN</code>	0x4000 bit 14, display dimmed																			
<code>I_LIGHTEN</code>	0x2000 bit 13, display bright																			
<code>I_TOUCHED</code>	0x1000 bit 12, touch test result																			
<code>I_Y_LOCK</code>	0x0800 bit 11, stop Y movement																			
<code>I_X_LOCK</code>	0x0400 bit 10, stop X movement																			
<code>I_TOPMOST</code>	0x0200 bit 9, draw on top of other images next update																			
<code>I_STAYONTOP</code>	0x0100 bit 8, draw on top of other images always																			
<code>I_TOUCH_DISABLE</code>	0x0020 bit 5, set to disable touch for this image, default=1 for movie, 0 for image																			
Example	<pre>img_ClearAttributes(Ihdl1, iWinbutton1, I_TOUCH_DISABLE); // Disable touch in all images img_ClearAttributes(hndl, ALL, I_Y_LOCK I_X_LOCK); // Allow all images to move in any direction</pre>																			

2.10.11 img_Touched(handle, index)

Syntax	img_Touched(handle, index);	
Arguments	handle, index	
	handle	Pointer to the Image List.
	index	Index of the images in the list.
Returns	Status	
	Status	Returns index or -1.
Description	<p>This function requires that an image control has been created with the file_LoadImageControl(...); function.</p> <p>Returns index if image touched or returns -1 if no image was touched.</p> <p>If index is passed as -1 the function tests all images and returns -1 if no image was touched or returns index.</p>	
Example	<pre>if(state == TOUCH_PRESSED) n := img_Touched(Ihdl, -1); //scan image list, looking for a touch if(n != -1) last := n; button := n; img_Lighten(Ihdl, n); //lighten the button touched img_Show(Ihdl, -1); // restore the images endif endif</pre>	

2.10.12 img_FileRead(*dest, size, handle, index)

Syntax	<code>img_FileRead(*dest, size, handle, index);</code>	
Arguments	*dest, size, handle, index	
	dest	Pointer to a destination memory buffer
	size	Number of bytes to be read
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	Count	
	Count	Returns number of characters read
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...);</code> function under Mode 3.</p> <p>Reads the number of bytes specified by "size" from the file referenced by "handle" into a destination memory buffer. If "dest" is zero, data is directed to GRAM window.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access.</p>	
Example	<code>res := img_FileRead(memblock, 20, hnd1);</code>	

2.10.13 img_FileSeek(handle, index, HiWord, LoWord)

Syntax	img_FileSeek(handle, index, HiWord, LoWord);	
Arguments	handle, index, HiWord, LoWord	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	HiWord	Contains the upper 16bits of the file position
	LoWord	Contains the lower 16bits of the file position
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...) function under Mode 3.</p> <p>Set file position to specified address for the file handle so subsequent data may be read from that position onwards with img_FileGetC(...), img_FileGetW(...) or img_FileGetS(...).</p> <p>Note: This function is only available for use on the Flash based PmmC version.</p> <p>Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access.</p>	
Example	<pre>res := img_FileSeek(hndl, 0, 0x1234); // Set file position to 0x00001234 (byte position 4660)</pre>	

2.10.14 img_FileIndex(handle, index, HiSize, LoSize, recordnum)

Syntax	img_FileIndex(handle, index, HiSize, LoSize, recordnum);	
Arguments	handle, index, HiWord, LoWord	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	HiSize	Contains the upper 16bits of the size of the file records
	LoSize	Contains the lower 16bits of the size of the file records
	recordnum	The index of the required record
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...); function under Mode 3.</p> <p>Set file seek position to specified address for the file handle so subsequent data may be read from that position onwards with img_FileGetC(...), img_FileGetW(...) or img_FileGetS(...).</p> <p>Note: This function is only available for use on the Flash based PmmC version.</p> <p>Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access.</p>	
Example	<pre>res := img_FileIndex(hndl, 0, 1000, 123, 1); // set file seek position to 123000</pre>	

2.10.15 img_FileTell(handle, index, &HiWord, &LoWord)

Syntax	img_FileTell(handle, index, &HiWord, &LoWord);	
Arguments	*dest, size, handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	HiWord	Specifies location for the upper 16bits of the file pointer
	LoWord	Specifies location for the lower 16bits of the file pointer
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...) function under Mode 3.</p> <p>Reads the current 32 bit file pointer and stores it into the two variables specified in "HiWord" and "LoWord".</p> <p>Note: This function is only available for use on the Flash based PmmC version.</p> <p>Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access.</p>	
Example	img_FileTell(hndl, index, Hiptr, Loptr);	

2.10.16 img_FileSize(handle, index, &HiWord, &LoWord)

Syntax	<code>img_FileSize(handle, index, &HiWord, &LoWord);</code>	
Arguments	*dest, size, handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	HiWord	Specifies location for the upper 16bits of the file size
	LoWord	Specifies location for the lower 16bits of the file size
Returns	Status	
	Status	Returns true if successful
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>Reads the 32-bit file size and stores it into the two variables specified in "HiWord" and "LoWord".</p> <p>Note: This function is only available for use on the Flash based PmmC version.</p> <p>Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access.</p>	
Example	<code>img_FileTell(hndl, index, Hiptr, Loptr);</code>	

2.10.17 img_FileGetC(handle, index)

Syntax	<code>img_FileGetC(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	byte	
	byte	Returns the data byte read from the file.
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>This function reads a byte from the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 1).</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>mychar := img_FileGetC(hndl, index);</code>	

2.10.18 img_FileGetW(handle, index)

Syntax	<code>img_FileGetW(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	byte	
	byte	Returns the word read from the file.
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>This function reads a word (2 bytes) from the file, at the position indicated by the associated file-position pointer and advances the pointer appropriately (incremented by 2).</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>mychar := img_FileGetW(hndl, index);</code>	

2.10.19 img_FileGetS(*string, size, handle, index)

Syntax	img_FileGetS(*string, size, handle, index);	
Arguments	*string, size, handle, index	
	string	Destination buffer
	size	The maximum number of bytes to be read from the file.
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	result	
	result	Returns pointer to string or null if failed
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...); function under Mode 3.</p> <p>This function reads a line of text to a buffer (specified by "*string") from a file at the current file position indicated by the associated file-position pointer and advances the pointer appropriately.</p> <p>This function reads only reads up to "size - 1" characters into "*string" (one character is reserved for the null-terminator). Characters are read until either a newline or an EOF is received or until the number of characters read reaches "size - 1" or a read error is received.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<pre>res := img_FileGets(mystr , 81, hnd1); // read up to 80 chars</pre>	

2.10.20 img_FileRewind(handle, index)

Syntax	<code>img_FileRewind(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	byte	
	byte	Returns true if file rewound successfully
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>Resets the file pointer to the beginning of the open file.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>res := img_FileRewind(hnd1, index);</code>	

2.10.21 img_FileLoadFunction(handle, index)

Syntax	img_FileLoadFunction(handle, index);	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	pointer	
	pointer	Returns a pointer to the memory allocation where the function has been loaded from file which can be then used as a function call.
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...); function under Mode 3.</p> <p>Load a function or program from disk and return a function pointer to the allocation.</p> <p>The function can then be invoked just like any other function would be called via a function pointer. Parameters may be passed to it in a conventional way. The callers stack is shared by the loaded function, however any global variables in the loaded function are private to that function.</p> <p>The function may be discarded at any time when no longer required, freeing its memory resources through mem_Free(..).</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<pre> Load function from file: popupWindow := img_FileLoadFunction(hndl, index); if(!popupWindow) goto LoadFunctionFailed; // Could not load the function Run the loaded function in program: res := popupWindow(MYMODE, "My Title", "My Popup Text"); if(res == QUIT_APPLICATION) goto exitApp; Freeing memory resource: res := mem_Free(popupWindow); if(!res) goto FreeFunctionFailed; // Could not free memory </pre>	

2.10.22 img_FileRun(handle, index, arglistptr)

Syntax	<code>img_FileRun(handle, index, arglistptr);</code>	
Arguments	handle, index, arglistptr	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	arglistptr	Pointer to the list of arguments to pass to the new program
Returns	value	
	value	Returns the value from main in the called program.
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>Load a program from disk where the current program releases any allocated memory but retains the stack and global memory.</p> <p>If arglistptr is 0, no arguments are passed, else, arglist points to an array, the first element being the number of elements in the array.</p> <p>The func 'main' in the called program accepts the arguments, if any. The arguments can only be passed by value, no pointers or references can be used as all memory is cleared before the file is loaded.</p> <p>Refer to <code>img_FileExec(...)</code> and <code>img_FileLoadFunction(...)</code> for functions that can pass by reference.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>res := img_FileRun(hndl, index, argptr);</code>	

2.10.23 img_FileExec(handle, index, arglistptr)

Syntax	img_FileExec(handle, index, arglistptr);	
Arguments	handle, index, arglistptr	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	arglistptr	Pointer to the list of arguments to pass to the new program
Returns	value	
	value	Returns the value from main in the called program.
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...) function under Mode 3.</p> <p>Load a program from disk and returns like a function, the calling program is kept active and control returns to it.</p> <p>The func 'main' in the called program accepts the arguments, if any. If arglistptr is 0, no arguments are passed, else arglist points to an array, the first element being the number of elements in the array.</p> <p>This function is similar to img_FileLoadFunction(...), however, the function argument list is passed by pointer, and the memory consumed by the function is released as soon as the function completes.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<pre>res := img_FileExec(hndl, index, argptr);</pre>	

2.10.24 img_FilePlayWAV(handle, index)

Syntax	<code>img_FilePlayWAV(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	byte	
	byte	If there are no errors, returns number of blocks to play (1 to 32767) If errors occurred, the following is returned: -7 : Insufficient memory available for WAV buffer and file -6 : cant play this rate -5 : no data chunk found in first rsector -4 : no format data -3 : no wave chunk signature -2 : bad wave file format -1 : file not found
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...);</code> function under Mode 3.</p> <p>Play a wave file at index "index" in the image filesystem "handle". This function automatically grabs a chunk of memory for a file buffer, and a wave buffer.</p> <p>The minimum memory requirement is about 580 bytes for the disk I/O service and a minimum wave buffer size of 1024. The size of the wave buffer allocation can be increased by the <code>snd_BufSize</code> function. The default size 1024 bytes. The memory is only required during the duration of play, and is automatically released while not in use.</p> <p>See Sound Control Functions for additional play control functions.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<pre>res := img_FileRewind(hnd1, index);</pre>	

2.10.25 img_TxtFontID(handle, index)

Syntax	<code>img_TxtFontID(handle, index);</code>	
Arguments	handle, index	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
Returns	none	
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...);</code> function under Mode 3.</p> <p>Set the font to a font held in the image file system.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>img_TxtFontID(hnd1, index);</code>	

2.10.26 img_FileCheckUpdate(handle, index, options)

Syntax	<code>img_FileCheckUpdate(handle, index, options);</code>
Arguments	handle , index , options
	handle Pointer to the image file control index Index of the entry in the handle options Program update options: CHECKUPDATE_QUERY 1 Checks the specified file and compares its DateTime to the program running in Flash. CHECKUPDATE_UPDATENEWER 2 Updates the program in Flash and resets the display if the program on uSD is newer. CHECKUPDATE_UPDATEALWAYS 3 Always updates the program in Flash and resets the display.
Returns	value If update occurs and the program is running from Flash, as display is reset after update. Otherwise if a query or an error occurs, the following is returned: CHECKUPDATE_NEWFILE 1 The specified file is newer than the file running in Flash. CHECKUPDATE_OLDFILE 2 The specified file is equal to or older than the file running in Flash. CHECKUPDATE_UPDATEDONE 3 An update was performed and the program is running from RAM. CHECKUPDATE_NOFILE 4 The specified file does not exist. CHECKUPDATE_INVALIDFILE 5 The specified file is not a valid .4xe or .4fn
Description	This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3 . Check and/or update the program running in flash using the specified file in Flash memory. Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access
Example	<pre>media_Init(); hdl := file_LoadImageControl(0, 0, 3); if (file_CheckUpdate(hndl, index,CHECKUPDATE_QUERY) == CHECKUPDATE_NEWFILE) print("Program will now update"); file_CheckUpdate(hndl, index, CHECKUPDATE_UPDATENEWER); endif</pre>

2.10.27 img_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap)

Syntax	img_FunctionCall(handle, index, state, &FunctionRam, &FunctionDef, FunctionArgCount, FunctionArgStringMap);	
Arguments	handle , index , state , &FunctionRam , &FunctionDef , FunctionArgCount , FunctionArgStringMap	
	handle	Pointer to the image file control
	index	Index of the entry in the handle
	state	Value passed to update function state
	&FunctionRam	Pointer to the function RAM allocation
	&FunctionDef	Pointer to the function definitions stored in Flash
	FunctionArgCount	Function argument count
	FunctionArgStringMap	String address array
Returns	value	
	value	Returns 0 if successful
Description	<p>This function requires that an image file control has been created with the file_LoadImageControl(...); function under Mode 3.</p> <p>This function loads and calls the Function found at index in the Flash GCI filesystem identified by handle.</p> <p>Parameters "state", "&FunctionRam", "&FunctionDef", "&FunctionDef" are passed. The first two parameters are passed "as is", since the third parameter is normally in flash and one programs flash is not accessible from another.</p> <p>The FunctionArgCount constant is copied into a RAM array and passed to the Function.</p> <p>The parameter FunctionStringMap is a bit array of the indexes containing single and multiple stringsthat are offset by 8. e.g. 0x0100 means parameter 8 is a single string, 0x0002 means parameter 9 is an array of strings with parameter 8 containing the count.</p> <p>Any function called this way is loaded into RAM and then left there. RAM is managed using a Least Recently Used (LRU) mechanism wherein the least recently used entry is freed if there is not enough Heap to load the desired function.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<pre>#DATA word IIMediaRotaryDef 20, 4, 179, 179, 16, RED, BROWN, GRAY, GRAY, ORANGE, YELLOW, 0x30FE, 3, 75, 13, 120, 2, 135, 405 #END var IMediaRotaryRAM[WIDGET_RAM_SPACE] ;</pre>	

```
var NewVal, hndl;  
  
void main()  
  
    img_FunctionCall(hndl, index, state, IMediaRotaryRAM, IIMediaRotaryDef,  
                      19, 0x0);  
repeat forever  
endfunc
```

2.10.28 img_FunctionFreeCache(handle)

Syntax	<code>img_FunctionFreeCache(handle);</code>	
Arguments	handle	
	handle	Pointer to the image file control
Returns	none	
Description	<p>This function requires that an image file control has been created with the <code>file_LoadImageControl(...)</code> function under Mode 3.</p> <p>Frees any RAM allocated to caching of functions located in the specified Flash GCI.</p> <p>Note: This function is only available for use on the Flash based PmmC version. Note: This function is only for files embedded in a GCF, for Flash only, ie this is not valid for GCI and uSD card access</p>	
Example	<code>img_FunctionFreeCache(hndl);</code>	

2.11. Maths Functions

Summary of functions in this section:

- ABS(value)
- MIN(value1, value2)
- MAX(value1, value2)
- SWAP(&var1, &var2)
- SIN(angle)
- COS(angle)
- RAND()
- SEED(number)
- SQRT(number)
- OVFI()
- CY()
- umul_1616(&res32, val1, val2)
- uadd_3232(&res32, &val1, &val2)
- usub_3232(&res32, &val1, &val2)
- ucmp_3232(&val1, &val2)
- udiv_3232(&res32, val1, val2)

2.11.1 ABS(value)

Syntax	ABS(value);
Arguments	value value a variable, array element, expression or constant. The arguments can be a variable, array element, expression or constant.
Returns	value value Returns the absolute value.
Description	This function returns the absolute value of value .
Example	<pre>var myvar, number; number := -100; myvar := ABS(number * 5);</pre> This example returns 500 in variable myvar .

2.11.2 MIN(value1, value2)

Syntax	MIN(value1, value2);	
Arguments	value1, value2	
	value1	A variable, array element, expression or constant.
	value2	A variable, array element, expression or constant.
	The arguments can be a variable, array element, expression or constant.	
Returns	value	
	value	The smaller of the two values.
Description	This function returns the the smaller of value1 and value2 .	
Example	<pre>var myvar, number1, number2; number1 := 33; number2 := 66; myvar := MIN(number1, number2);</pre>	
	This example returns 33 in variable myvar .	

2.11.3 MAX(value1, value2)

Syntax	MAX(value1, value2);	
Arguments	value1, value2	
	value1	A variable, array element, expression or constant.
	value2	A variable, array element, expression or constant.
	The arguments can be a variable, array element, expression or constant.	
Returns	value	
	value	The larger of the two values.
Description	This function returns the the larger of value1 and value2 .	
Example	<pre>var myvar, number1, number2; number1 := 33; number2 := 66; myvar := MAX(number1, number2);</pre>	
	This example returns 66 in variable myvar .	

2.11.4 SWAP(&var1, &var2)

Syntax	SWAP(&value1, &value2);
Arguments	&var1, &var2 &var1 The address of the first variable. &var2 The address of the second variable. The arguments can only be a variable or an array element.
Returns	nothing
Description	Given the addresses of two variables (var1 and var2), the values at these addresses are swapped.
Example	<pre>var number1, number2; number1 := 33; number2 := 66; SWAP (&number1, &number2);</pre> This example swaps the values in number1 and number2 . After the function is executed, number1 will hold 66, and number2 will hold 33.

2.11.5 SIN(angle)

Syntax	SIN(angle);	
Arguments	angle	
	angle	The angle in degrees. Note: The input value is automatically shifted to lie within 0-359 degrees
		The arguments can be a variable, array element, expression or constant.
Returns	result	
	result	The sine in radians of an argument specified in degrees. The returned value range is from 127 to -127 which is a more useful representation for graphics work. The real sine values vary from 1.0 to -1.0 so appropriate scaling must be done in user code as required.
Description	This function returns the sine of an angle	
Example	<pre>var myvar, angle; angle := 133; myvar := SIN(angle);</pre> This example returns 92 in variable myvar .	

2.11.6 COS(angle)

Syntax	COS(angle);	
Arguments	angle	
	angle	The angle in degrees. Note: The input value is automatically shifted to lie within 0-359 degrees
		The arguments can be a variable, array element, expression or constant.
Returns	result	
	result	The cosine in radians of an argument specified in degrees. The returned value range is from 127 to -127 which is a more useful representation for graphics work. The real sine values vary from 1.0 to -1.0 so appropriate scaling must be done in user code as required.
Description	This function returns the cosine of an angle	
Example	<pre>var myvar, angle; angle := 133; myvar := COS(angle);</pre> This example returns -86 in variable myvar .	

2.11.7 RAND()

Syntax	RAND();
Arguments	none
Returns	value
	value Returns a pseudo random signed number ranging from -32768 to +32767 each time the function is called. The random number generator may first be seeded by using the SEED(number) function. The seed will generate a pseudo random sequence that is repeatable. You can use the modulo operator (%) to return a number within a certain range, eg n := RAND() % 100; will return a random number between -99 and +99. If you are using random number generation for random graphics points, or only require a positive number set, you will need to use the ABS function so only a positive number is returned, eg: X1 := ABS(RAND() % 100); will set co-ordinate X1 between 0 and 99. Note that if the random number generator is not seeded, the first number returned after reset or power up will be zero. This is normal behavior.
Description	This function returns a pseudo random signed number ranging from -32768 to +32767
Example	<pre>SEED(1234); print(RAND(), ", ", RAND());</pre> This example will print 3558, 1960 to the display.

2.11.8 SEED(number)

Syntax	SEED(number);
Arguments	number number Specifies the seed value for the pseudo random number generator. The arguments can be a variable, array element, expression or constant.
Returns	nothing
Description	This function seeds the pseudo random number generator so it will generate a new repeatable sequence. The seed value can be a positive or negative number.
Example	<pre>SEED(-50); print(RAND(), ", ", RAND());</pre> This example will print 30129, 27266 to the display.

2.11.9 SQRT(number)

Syntax	SQRT(number);	
Arguments	number	
	number	Specifies the positive number for the SQRT function. The arguments can be a variable, array element, expression or constant.
Returns	value	This function returns the integer square root which is the greatest integer less than or equal to the square root of number .
Description	This function returns the integer square root of a number.	
Example	<pre>var myvar; myvar := SQRT(26000);</pre>	
	This example returns 161 in variable myvar which is the integer square root of 26000.	

2.11.10 OVF()

Syntax	OVF();
Arguments	none
Returns	value
	value The high order 16 bits from certain math and shift functions.
Description	This function returns the high order 16 bits from certain math and shift functions. It is extremely useful for calculating 32 bit address offsets for MEDIA access. It can be used with the shift operations, addition, subtraction, multiplication and modulus operations.
Example	<pre>var loWord, hiWord; loWord := 0x2710 * 0x2710; // (10000 * 10000 in hex format) hiWord := OVF(); print ("0x", [HEX] hiWord, [HEX] loWord);</pre> <p>This example will print 0x05F5E100 to the display , which is 100,000,000 in hexadecimal</p>

2.11.11 CY()

Syntax	CY();	
Arguments	none	
Returns	status	
	status	Returns status of carry, 0 or 1.
Description	This function returns the carry status of an unsigned overflow from any 16 or 32bit additions or subtractions.	
Example	<pre>var myvar; myvar := 0xFFFF8 + 9; // result = 1 print("myvar ", myvar, "\nCarry ", CY(), "\n"); // carry = 1</pre> <p>This example will print myvar 1 Carry 1</p>	

2.11.12 umul_1616(&res32, val1, val2)

Syntax	umul_1616(&res32, val1, val2);	
Arguments	&res32, val1, val2	
	&res32	Points to 32bit result register.
	val1	16bit register or constant
	val2	16bit register or constant
Returns	pointer	
	pointer	Returns a pointer to the 32bit result. Carry and overflow are not affected.
Description	Performs an unsigned multiply of 2 x 16bit values placing the 32bit result in a 2 word array.	
Example	<pre>var val32[2]; var p; umul_1616(val32, 500, 2000); p := str_Ptr(val32); str_Printf(&p, "%ld");</pre> This example prints 1000000	

2.11.13 uadd_3232(&res32, &val1, &val2)

Syntax	uadd_3232(&res32, &val1, &val2);	
Arguments	&res32, &val1, &val2)	
	&res32	Points to 32bit result register.
	&val1	points to 32bit augend
	&val2	points to 32bit addend
Returns	value	
	value	Returns 1 on 32bit unsigned overflow (carry). Carry flag is also set on 32bit unsigned overflow and can be read with the CY() function.
Description	Performs an unsigned addition of 2 x 32bit values placing the 32bit result in a 2 word array.	
Example	<pre>var carry, valA[2], valB[2], Result[2]; var p; valA[0] := 0; valA[1] := 1; valB[0] := 0; valB[1] := 1; carry := uadd_3232(Result, valA, valB); p := str_Ptr(Result); print("0x"); str_Printf(&p, "%lX"); //prints the value at pointer in Hex long format. This example will print 0x20000</pre>	

2.11.14 usub_3232(&res32, &val1, &val2)

Syntax	usub_3232(&res32, &val1, &val2);	
Arguments	&res32, &val1, &val2	
	&res32	Points to 32bit result register.
	&val1	points to 32bit augend
	&val2	points to 32bit addend
Returns	value	
	value	Returns 1 on 32bit unsigned overflow (carry). Carry flag is also set on 32bit unsigned overflow and can be read with the CY() function.
Description	Performs an unsigned subtraction of 2 x 32bit values placing the 32bit result in a 2 word array.	
Example	<pre>var carry, valA[2], valB[2], Result[2]; var p; valA[0] := 0; valA[1] := 0xFFFF; valB[0] := 0; valB[1] := 0xEFFF; carry := usub_3232(Result, valA, valB); p := str_Ptr(Result); print("0x"); str_Printf(&p, "%lX"); repeat forever</pre> <p>This example will print 0x10000000</p>	

2.11.15 ucmp_3232(&val1, &val2)

Syntax	<code>ucmp_3232(&val1, &val2);</code>
Arguments	&val1, &val2 &val1 points to 32bit augend &val2 points to 32bit addend
Returns	value value 0 if equal 1 if val1 > val2 -1 if val1 < val2 This function does not affect the carry flag.
Description	Performs an unsigned comparison of 2 x 32bit values. The result of the subtraction is returned.
Example	<pre>var valA[2], valB[2], Result; valA[0] := 0; valA[1] := 0xFFFF; valB[0] := 0; valB[1] := 0xEFFF; Result := ucmp_3232(valA, valB); //val1 > val2 print(Result); repeat forever</pre> This example will print 1.

2.11.16 udiv_3232(&res32, val1, val2)

Syntax	udiv_3232(&res32, val1, val2);	
Arguments	&res32, val1, val2	
	&res32	Points to 32bit result register.
	val1	32bit register or dividend
	val2	32bit register or divisor
Returns	pointer	
	pointer	Returns a pointer to the 32bit result. Carry and overflow are not affected.
Description	Performs an unsigned division of 2 x 32bit values placing the 32bit result in a 2 word array. Note: A division by zero will result in 0xFFFFFFFF	
Example	<pre>var val32[2], dividend[2], divisor[2] ; var p; dividend[0] := 0x5c21 ; // part of 1661985 dividend[1] := 0x19 ; // part of 1661985 divisor[0] := 13 ; divisor[1] := 0 ; udiv_3232(val32, dividend, divisor); p := str_Ptr(val32); str_Printf(&p, "%ld"); // 1661985 / 13 = 127845</pre>	

2.12. Media Functions (SD/SDHC Memory Card or Serial Flash chip)

The media can be SD/SDHC, microSD or serial (NAND) flash device interfaced to the SPI port.

- media_Init()
- media_InitSpeed(speed)
- media_SetAdd(Hlword, LOword)
- media_SetSector(Hlword, LOword)
- media_RdSector(Destination_Address)
- media_WrSector(Source_Address)
- media_ReadByte()
- media_ReadWord()
- media_WriteByte(byte_val)
- media_WriteWord(word_val)
- media_Flush()
- media_Image(x, y)
- media_Video(x, y)
- media_VideoFrame(x, y, frameNumber)

2.12.1 media_Init()

Syntax	<code>media_Init();</code>
Arguments	<code>none</code>
Returns	result <div style="border: 1px solid black; padding: 5px;"> Returns: 1 if uSD is found, and has been successfully initialised Returns: 0 if uSD is not present, or SPI memory is present </div> <p>Note: For systems with SPI Flash memory device the response will be 0, however, this function still needs to be called to initialise the Flash memory chip. </p>
Description	Initialise a uSD/SD/SDHC memory card or a SPI Flash memory device (< 32 MB) for further operations. The SD card or Flash device is connected to the SPI (serial peripheral interface) of the processor.
Example	<p>This example waits for SD card to be inserted and initialised, flashing a message if no SD card detected.</p> <pre>while(!media_Init()) gfx_Cls(); pause(300); puts("Please insert SD card"); pause(300); wend</pre> <p>This example simply initialises the SPI Flash memory</p> <pre>if(!media_Init()) puts("Flash memory initialised") endif</pre>

2.12.2 media_Init4()

Syntax	<code>media_Init4(command);</code>						
Arguments	<p>command</p> <table border="1"> <tbody> <tr> <td>FLASH_ADDR_DEF_COMMAND</td><td>The default command will be used to switch most chips into 4 byte mode (0xB7)</td></tr> <tr> <td>FLASH_ADDR_ALWAYS_4BYTE</td><td>No command will be sent (for chips permanently in 4 byte mode)</td></tr> <tr> <td>0x??</td><td>For chips that don't use 0xB7 to put them into 4 byte mode. Refer to the Datasheet associated with the Flash Memory in question.</td></tr> </tbody> </table>	FLASH_ADDR_DEF_COMMAND	The default command will be used to switch most chips into 4 byte mode (0xB7)	FLASH_ADDR_ALWAYS_4BYTE	No command will be sent (for chips permanently in 4 byte mode)	0x??	For chips that don't use 0xB7 to put them into 4 byte mode. Refer to the Datasheet associated with the Flash Memory in question.
FLASH_ADDR_DEF_COMMAND	The default command will be used to switch most chips into 4 byte mode (0xB7)						
FLASH_ADDR_ALWAYS_4BYTE	No command will be sent (for chips permanently in 4 byte mode)						
0x??	For chips that don't use 0xB7 to put them into 4 byte mode. Refer to the Datasheet associated with the Flash Memory in question.						
Returns	<p>result</p> <table border="1"> <tbody> <tr> <td></td><td> Returns: 1 if uSD is found (Error, this command should not be used when a uSD card is present) Returns: 0 if uSD is not present (good) and therefore SPI memory card is present and successfully initialised </td></tr> <tr> <td></td><td> Note: For systems with SPI Flash memory device the response will be 0, however, this function still needs to be called to initialise the Flash memory chip. </td></tr> </tbody> </table>		Returns: 1 if uSD is found (Error, this command should not be used when a uSD card is present) Returns: 0 if uSD is not present (good) and therefore SPI memory card is present and successfully initialised		Note: For systems with SPI Flash memory device the response will be 0, however, this function still needs to be called to initialise the Flash memory chip.		
	Returns: 1 if uSD is found (Error, this command should not be used when a uSD card is present) Returns: 0 if uSD is not present (good) and therefore SPI memory card is present and successfully initialised						
	Note: For systems with SPI Flash memory device the response will be 0, however, this function still needs to be called to initialise the Flash memory chip.						
Description	The command used to set the flash memory into 4 byte addressing mode. This is not used with uSD cards, only for SPI flash memory that requires 4 byte addressing (ie cards > 32MB). The SPI Flash device is connected to the SPI (serial peripheral interface) of the processor.						
Example	<p>This example simply initialises the SPI Flash memory into 4 byte mode for a 32MB card</p> <pre>if(!media_Init4(FLASH_ADDR_DEF_COMMAND)) puts("Flash memory initialised") Endif</pre>						

2.12.3 media_InitSpeed(speed)

Syntax	media_InitSpeed();	
Arguments	speed	
	speed	Specifies the speed. Speed can be from SPI_SPEED0 (slowest) to SPI_SPEED15 (fastest).
		The argument can be a variable, array element, expression or constant
Returns	result	
	result	Returns 1 if memory card is successfully initialised, otherwise returns 0
Description	Initialise a uSD/SD/SDHC memory card at a given speed. The SD card is connected to the SPI (Serial Peripheral Interface) of the processor.	
Example	<pre>while(!media_InitSpeed(SPI_SPEED0)) gfix_Cls(); pause(300); puts("Please insert SD card"); pause(300); wend</pre>	
	This example waits for SD card to be inserted and initialised at SPI_SPEED0, flashing a message if no SD card detected.	

2.12.4 media_SetAdd(Hlword, LWord)

Syntax	media_SetAdd(Hlword, LWord);
Arguments	Hlword, LWord
	Hlword Specifies the high word (upper 2 bytes) of a 4 byte media memory byte address location.
	LWord Specifies the low word (lower 2 bytes) of a 4 byte media memory byte address location.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Set media memory internal Address pointer for access at a non sector aligned byte address.
Example	<pre>media_SetAdd(0, 513);</pre> This example sets the media address to byte 513 (which is sector #1, 2 nd byte in sector) for subsequent operations.

2.12.5 media_SetSector(Hlword, LOword)

Syntax	<code>media_SetSector(Hlword, LOword);</code>
Arguments	Hlword, LOword
	Hlword Specifies the high word (upper 2 bytes) of a 4 byte media memory sector address location.
	LOword Specifies the low word (lower 2 bytes) of a 4 byte media memory sector address location.
	The arguments can be a variable, array element, expression or constant
Returns	result
Description	Set media memory internal Address pointer for sector access.
Example	<code>media_SetSector(0, 10);</code> This example sets the media address to the 11 th sector (which is also byte address 5120) for subsequent operations

2.12.6 media_RdSector(Destination_Address)

Syntax	media_RdSector(Destination_Address);
Arguments	Destination_Address
	Destination_Address Destination block pointed to by the internal Sector pointer. The argument must be a pointer to an array of size 256 words for the sector data which will be 512 bytes
Returns	Returns TRUE if media response was TRUE. Returns 512 bytes (256 words) in to a destination block.
Description	Reads and Returns 512 bytes (256 words) into a destination block (eg rdblock[256]) pointed to by the internal Sector pointer. After the read the Sector pointer is automatically incremented by 1.
Example	<pre>var rdblock[256]; media_SetSector(0,10) if (media_RdSector(rdblock)); Print("Data collected"); endif</pre> <p>This example sets a 512 bytes block and collects data from the address pointed to by media_SetSector() function.</p>

2.12.7 media_WrSector(Source_Address)

Syntax	media_WrSector(Source_Address);
Arguments	Source_Address Source_Address Source memory block of 512bytes. The arguments can be a variable, array element, expression or constant
Returns	Returns TRUE if media response was TRUE.
Description	Writes 512 bytes (256 words) from a source memory block (eg wrblock[256]) into the uSD card. After the write the Sect pointer is automatically incremented by 1.
Example	<pre>var wrblock[256]; func main() prepare_block(); media_SetSector(0,10) if (media_WrSector(wrblock)) print("Data transferred"); endif</pre> This example sets a 512 bytes block and transfers data to the address pointed to by media_SetSector() function.

2.12.8 media_ReadByte()

Syntax	<code>media_ReadByte();</code>
Arguments	<code>none</code>
Returns	<code>byte value</code>
Description	Returns the byte value from the current media address. The internal byte address will then be internally incremented by one.
Example	<pre>var LObyte, HIbyte; if(media_Init()) media_SetAdd(0, 510); LObyte := media_ReadByte(); HIbyte := media_ReadByte(); print([HEX2]HIbyte, [HEX2]LObyte); endif repeat forever</pre> <p>This example initialises the media, sets the media byte address to 510, and reads the last 2 bytes from sector 0. If the card happens to be FAT formatted, the result will be "AA55". The media internal address is internally incremented for each of the byte operations.</p>

2.12.9 media_ReadWord()

Syntax	<code>media_ReadWord();</code>
Arguments	<code>none</code>
Returns	<code>word value</code>
Description	Returns the word value (2 bytes) from the current media address. The internal byte address will then be internally incremented by one. If the address is not aligned, the word will still be read correctly.
Example	<pre>var myword; if(media_Init()) media_SetAdd(0, 510); myword := media_ReadWord(); print([HEX4]myword); endif repeat forever</pre> <p>This example initialises the media, sets the media byte address to 510 and reads the last word from sector 0. If the card happens to be formatted, the result will be "AA55"</p>

2.12.10 media_WriteByte(byte_val)

Syntax	media_WriteByte(byte_val);	
Arguments	byte_val	
	byte_val	The lower 8 bits specifies the byte to be written at the current media address location.
	The arguments can be a variable, array element, expression or constant	
Returns	success	
	success	Returns non zero if write was successful.
Description	Writes a byte to the current media address that was initially set with media_SetSector() . Note: Writing bytes or words to a media sector must start from the beginning of the sector. All writes will be incremental until the media_Flush() function is executed, or the sector address rolls over to the next sector. When media_Flush() is called, any remaining bytes in the sector will be padded with 0xFF, destroying the previous contents. An attempt to use the media_SetAdd() function will result in the lower 9 bits being interpreted as zero. If the writing rolls over to the next sector, the media_Flush() function is issued automatically internally.	
Example	<pre> var n, char; while (media_Init()==0); // wait if no SD card detected media_SetSector(0, 2); // at sector 2 //media_SetAdd(0, 1024); // (alternatively, use media_SetAdd(), // // lower 9 bits ignored) while (n < 10) media_WriteByte(n++ +'0'); // write ASCII '0123456789' to the wend // first 10 locations. to(MDA); putstr("Hello World"); // now write a ascii test string media_WriteByte('A'); // write a further 3 bytes media_WriteByte('B'); media_WriteByte('C'); media_WriteByte(0); // terminate with zero media_Flush(); // we're finished, close the sector media_SetAdd(0, 1024+5); // set the starting byte address while(char:=media_ReadByte()) putch(char); // print result, starting // from '5' repeat forever </pre> <p>This example initialises the media, writes some bytes to the required sector, then prints the result from the required location.</p>	

2.12.11 media_WriteWord(word_val)

Syntax	media_WriteWord(word_val);	
Arguments	word_val	
	word_val	The 16 bit word to be written at the current media address location.
		The arguments can be a variable, array element, expression or constant
Returns	success	
	success	Returns non zero if write was successful.
Description	<p>Writes a word to the current media address that was initially set with media_SetSector().</p> <p>Note: Writing bytes or words to a media sector must start from the beginning of the sector. All writes will be incremental until the media_Flush() function is executed, or the sector address rolls over to the next sector. When media_Flush() is called, any remaining bytes in the sector will be padded with 0xFF, destroying the previous contents. An attempt to use the media_SetAdd() function will result in the lower 9 bits being interpreted as zero. If the writing rolls over to the next sector, the media_Flush() function is issued automatically internally.</p>	
Example	<pre> var n; while (media_Init()==0); // wait until a good SD card is found n:=0; media_SetAdd(0, 1536); // set the starting byte address while (n++ < 20) media_WriteWord(RAND()); // write 20 random words to first 20 wend // word locations. n:=0; while (n++ < 20) media_WriteWord(n**1000); // write sequence of 1000*n to next 20 wend // word locations. media_Flush(); // we're finished, close the sector media_SetAdd(0, 1536+40); // set the starting byte address n:=0; while(n++<8) // print result of fist 8 multiplication calcs print([HEX4] media_ReadWord(),"\n"); wend repeat forever </pre> <p>This example initialises the media, writes some words to the required sector, then prints the result from the required location.</p>	

2.12.12 media_Flush()

Syntax	<code>media_Flush();</code>
Arguments	<code>none</code>
Returns	returns 0 if Failed returns non-zero if OK
Description	After writing any data to a sector, media_Flush() should be called to ensure that the current sector that is being written is correctly stored back to the media else write operations may be unpredictable.
Example	See the media_WriteByte(...) and media_WriteWord(...) examples.

2.12.13 media_Image(x, y)

Syntax	media_Image(x, y);
Arguments	x, y
	x, y specifies the top left position where the image will be displayed. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Displays an image from the media storage at the specified co-ordinates. The image address is previously specified with the media_SetAdd() or media_SetSector() function. If the image is shown partially off screen, it may not be displayed correctly.
Example	<pre>while(media_Init()==0); // wait if no SD card detected media_SetAdd(0x0001, 0xDA00); // point to the books04 image media_Image(10,10); gfx_Clipping(ON); // turn off clipping to see the difference media_Image(-12,50); // show image off-screen to the left media_Image(50,-12); // show image off-screen at the top repeat forever</pre> <p>This example draws an image at several positions, showing the effects of clipping.</p>

2.12.14 media_Video(x, y)

Syntax	media_Video(x, y);
Arguments	x, y x, y specifies the top left position where the video clip will be displayed. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Displays a <i>video</i> clip from the media storage device at the specified co-ordinates. The <i>video</i> address location in the media is previously specified with the media_SetAdd() or media_SetSector() function. If the <i>video</i> is shown partially off screen, it may not be displayed correctly. Note that showing a <i>video</i> blocks all other processes until the video has finished showing. See the media_VideoFrame() functions for alternatives.
Example	<pre>while(media_Init()==0); // wait if no SD card detected media_SetAdd(0x0001, 0x3C00); // point to the 10-gear clip media_Video(10,10); gfx_Clipping(ON); // turn off clipping to see the difference media_Video(-12,50); // show video off-screen to the left media_Video(50,-12); // show video off-screen at the top repeat forever</pre> <p>This example plays a video clip at several positions, showing the effects of clipping.</p>

2.12.15 media_VideoFrame(x, y, frameNumber)

Syntax	media_VideoFrame(x, y, frameNumber);
Arguments	<p>x, y</p> <p>x, y specifies the top left position where the video clip will be displayed.</p> <p>frameNumber Specifies the required frame to be shown.</p> <p>The arguments can be a variable, array element, expression or constant</p>
Returns	nothing
Description	<p>Displays a <i>video</i> from the media storage device at the specified co-ordinates. The <i>video</i> address is previously specified with the media_SetAdd() or media_SetSector() function. If the <i>video</i> is shown partially off it may not be displayed correctly. The frames can be shown in any order. This function gives you great flexibility for showing various icons from an image strip, as well as showing videos while doing other tasks</p> <p>media_VideoFrame(...) will now show error box for out of range video frames. Also, if frame is set to -1, just a rectangle will be drawn in background colour to blank an image.</p>
Example	<pre>var frame; while (media_Init() == 0); // wait if no SD card detected while (media_Init() == 0); // wait if no SD card detected media_SetAdd(0x0002, 0x3C00); // point to the 10-gear image repeat frame := 0; // start at frame 0 repeat media_VideoFrame(30, 30, frame++); // display a frame pause(peekB(IMAGE_DELAY)); // pause for the time given in // the image header until(frame == peekW(IMG_FRAME_COUNT)); // loop until we've // shown all the frames forever // do it forever</pre> <p>This first example shows how to display frames as required while possibly doing other tasks. Note that the frame timing (although not noticeable in this small example) is not correct as the delay commences after the image frame is shown, therefore adding the display overheads to the frame delay. This second example employs a timer for the framing delay, and shows the same movie simultaneously running forward and backwards with time left for other tasks as well. A number of videos (or animated icons) can be shown simultaneously using this method.</p> <pre>var framecount, frame, delay, colr; frame := 0; // show the first frame so we can get the video header info // into the system variables, and then to our local variables. media_VideoFrame(30, 30, 0); framecount := peekW(IMG_FRAME_COUNT); // we can now set some local // values. delay := peekB(IMAGE_DELAY); // get the frame count and delay repeat repeat pokeW(TIMER0, delay); // set a timer</pre>

```
media_VideoFrame(30,30, frame++); // show next frame
gfx_MoveTo(64,35);
print([DEC2Z] frame);           // print the frame number
media_VideoFrame(30,80, framecount-frame); // show movie
                                // backwards.
gfx_MoveTo(64,85);
print([DEC2Z] framecount-frame); // print the frame number

if ((frame & 3) == 0)
    gfx_CircleFilled(80,20,2,colr); // a blinking circle fun
    colr := colr ^ 0xF800;        // alternate colour,
endif                           // BLACK/RED using XOR
// do more here if required
while(peekW(TIMER0));          // wait for timer to expire
until(frame == peekW(IMG_FRAME_COUNT));
frame := 0;
forever
```

2.13. Memory Allocation Functions

Summary of functions in this section:

- mem_Alloc(size)
- mem_AllocV(size)
- mem_AllocZ(size)
- mem_Realloc(ptr, size)
- mem_Free(allocation)
- mem_Heap()
- mem_Set(ptr, char, size)
- mem_Copy(source, destination, count)
- mem_Compare(ptr1, ptr2, count)

2.13.1 mem_Alloc(size)

Syntax	mem_Alloc(size);	
Arguments	size (byte)	
	size	Specifies the number of bytes that's allocated from the heap.
Returns	value	
	value	Returned value is the pointer (Word) to the allocation if successful. If function fails returns a null (0).
Description	Allocate a block of memory to a pointer. The allocated memory contains garbage but is a fast allocation. The block must later be released with mem_Free(...) .	
Example	<code>myvar := mem_Alloc(100);</code>	

2.13.2 mem_AllocV(size)

Syntax	mem_AllocV(size);	
Arguments	size (Byte)	
	size	Specifies the number of bytes that's allocated from the heap.
Returns	value	
	value	Returned value is the pointer (Word) to the allocation if successful. If function fails returns a null (0).
Description	Allocate a block of memory to a pointer. The block of memory is filled with initial signature values. The block starts with A5,5A then fills with incrementing number eg:- A5,5A,00,01,02,03...FF,00,11.... This can be helpful when debugging. The block must later be released with mem_Free(...) .	
Example	<code>myvar := mem_AllocV(100);</code>	

2.13.3 mem_AllocZ(size)

Syntax	<code>mem_AllocZ(size);</code>	
Arguments	size	
	size	Specifies the number of bytes that's allocated from the heap.
Returns	value	
	value	Returned value is the pointer to the allocation if successful. If function fails returns a null (0).
Description	Allocate a block of memory to pointer myvar. The block of memory is filled with zeros. The block must later be released with mem_Free(...) .	
Example	<code>myvar := mem_AllocZ(100);</code>	

2.13.4 mem_Realloc(ptr, size)

Syntax	mem_Realloc(ptr, size);	
Arguments	ptr, size	
	ptr	Specifies the new location to reallocate the memory block.
	size	Specifies the number of bytes of the block.
Returns	newptr	
	newptr	Pointer to the new object location
Description	<p>The function may move the memory block to a new location, in which case the pointer to the new location is returned. The content of the memory block is preserved up to the lesser of the new and old sizes, even if the block is moved. If the new size is larger, the value of the newly allocated portion is indeterminate. In case that ptr is NULL, the function behaves exactly as mem_Alloc(...), assigning a new block of size bytes and returning a pointer to the beginning of it. In case that the size is 0, the memory previously allocated in ptr is deallocated as if a call to mem_Free(...) was made, and a NULL pointer is returned.</p>	
Example	<pre>newptr := mem_Realloc(myPtr, 100);</pre>	

2.13.5 mem_Free(allocation)

Syntax	mem_Free(allocation);	
Arguments	allocation	
	allocation	Specifies the location of memory block to free up.
Returns	status	
	status	Returns non-zero if function is successful, otherwise 0 if it fails
Description	The function de-allocates a block of memory previously created with mem_Alloc(...) , mem_AllocV(...) or mem_AllocZ(...) .	
Example	<code>myvar := mem_Free(buffer);</code>	

2.13.6 mem_Heap()

Syntax	mem_Heap();	
Arguments	none	
Returns	value	
	value	Returns the largest available memory chunk of the heap.
Description	Returns byte size of the largest chunk of memory available in the heap.	
Example	howmuch := mem_Heap();	

2.13.7 mem_Set(ptr, char, size)

Syntax	mem_Set(ptr, char, size);	
Arguments	ptr, char, size	
	ptr	Specifies the memory block.
	char	Specifies the value to fill the block with.
	size	Specifies the size of the block in Bytes.
Returns	pointer	
	pointer	Returns the pointer
Description	Fill a block of memory with a byte value.	
Example	<pre>var mybuf[5]; var i; func main() mem_Set(mybuf,0x55,5); //Only fills half of mybuf[] for(i:=0;i<sizeof(mybuf);i++) //Show what is in the buffer print(" 0x",[HEX]mybuf[i]); next mem_Set(mybuf,0xAA,sizeof(mybuf)*2); //Fill entire buffer print("\n"); //New line for(i:=0;i<sizeof(mybuf);i++) print(" 0x",[HEX]mybuf[i]); next repeat forever endfunc</pre>	

2.13.8 mem_Copy(source, destination, count)

Syntax	<code>mem_Copy(source, destination, count);</code>	
Arguments	source, destination, count	
	source	Specifies the source memory block.
	destination	Specifies the destination memory block.
	count	Specifies the size of the blocks.
Returns	pointer	
	pointer	Returns source
Description	Copy a block of memory from source to destination. Note: Source can also be a string constant eg: <code>myptr := mem_Copy("TEST STRING", ptr2, 12);</code>	
Example	<code>myptr := mem_Copy(ptr1, ptr2, 100);</code>	

2.13.9 mem_Compare(ptr1, ptr2, count)

Syntax	mem_Compare(ptr1, ptr2, count);	
Arguments	ptr1, ptr2, count	
	ptr1	Specifies the 1st memory block.
	ptr2	Specifies the 2nd memory block.
	count	Specifies the number of bytes to compare.
Returns	value	
	value	Returns 0 if we have a match, -1 if ptr1 < ptr2, and +1 if ptr2 > ptr1. (The comparison is done alphabetically)
Description	Compare two blocks of memory ptr1 and ptr2 .	
Example	test := mem_Compare(this_block, that_block, 100);	

2.14. Misc System Functions

Summary of functions in this section:

- sys_PmmC()
- sys_Driver()

2.14.1 sys_PmmC()

Syntax	<code>sys_Pmmc();</code>
Arguments	<code>none</code>
Returns	Value of PmmC version
Description	Prints the system PmmC name and revision, eg "PIXXI\n1.0". Can be captured to a buffer using the to() function.
Example	<code>to(myString); sys_PmmC(); // save PmmC name and revision to buffer</code>

2.14.2 sys_Driver()

Syntax	<code>sys_Driver();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Prints the system driver name and date string, eg " pixxiLCD-XXXXX". Can be captured to a buffer using the <code>to()</code> function.
Example	<code>to(mystring); sys_Driver(); // save Driver name to buffer</code>

2.15. Serial (UART) Communications Functions

Summary of functions in this section:

- setbaud(rate)
- com_SetBaud(comport, baudrate/10)
- com_Mode(Databits, parity, Stopbits, comport)
- serin()
- serout(char)
- com_Init(buffer, bufsize, qualifier)
- com_Reset()
- com_Count()
- com_Full()
- com_Error()
- com_Sync()
- com_TXbuffer(buf, bufsize,pin)
- com_TXbufferHold(state)
- com_TXcount()
- com_TXemptyEvent(function)
- com_InitBrk(buffer, bufsize, qualifier) **or** com1_InitBrk(buffer, bufsize, qualifier)
- com_TXbufferBrk(buf, buffsize, pin) **or** com1_TXbufferBrk(buf, buffsize, pin)

2.15.1 setbaud(rate)

Syntax	setbaud(rate);																																																																			
Arguments	rate																																																																			
	rate	specifies the baud rate divisor value or pre-defined constant																																																																		
	The arguments can be a variable, array element, expression or constant																																																																			
Returns	nothing																																																																			
Description	<p>Use this function to set the required baud rate of COM0.</p> <p>The default Baud Rate for COM0 is 115,200 bits per second or 115,200 baud.</p> <p>There are pre-defined baud rate constants for most common baud rates:</p> <table border="1"> <thead> <tr> <th>Rate / Predefined Constant</th> <th>Error %</th> <th>Actual Baud Rate</th> </tr> </thead> <tbody> <tr><td>BAUD_110</td><td>0.00%</td><td>110</td></tr> <tr><td>BAUD_300</td><td>0.00%</td><td>300</td></tr> <tr><td>BAUD_600</td><td>0.00%</td><td>600</td></tr> <tr><td>BAUD_1200</td><td>0.00%</td><td>1200</td></tr> <tr><td>BAUD_2400</td><td>0.04%</td><td>2401</td></tr> <tr><td>BAUD_4800</td><td>0.04%</td><td>4802</td></tr> <tr><td>BAUD_9600</td><td>0.16%</td><td>9615</td></tr> <tr><td>BAUD_14400</td><td>0.27%</td><td>14439</td></tr> <tr><td>BAUD_19200</td><td>0.38%</td><td>19273</td></tr> <tr><td>BAUD_31250</td><td>0.00%</td><td>31250</td></tr> <tr><td>MIDI</td><td>0.00%</td><td>31250</td></tr> <tr><td>BAUD_38400</td><td>0.83%</td><td>38717</td></tr> <tr><td>BAUD_56000</td><td>0.16%</td><td>56090</td></tr> <tr><td>BAUD_57600</td><td>1.27%</td><td>58333</td></tr> <tr><td>BAUD_115200</td><td>2.64%</td><td>118243</td></tr> <tr><td>BAUD_128000</td><td>0.53%</td><td>128676</td></tr> <tr><td>BAUD_256000</td><td>0.53%</td><td>257353</td></tr> <tr><td>BAUD_300000</td><td>4.17%</td><td>312500</td></tr> <tr><td>BAUD_375000</td><td>6.06%</td><td>397727</td></tr> <tr><td>BAUD_500000</td><td>9.38%</td><td>546875</td></tr> <tr><td>BAUD_600000</td><td>4.17%</td><td>625000</td></tr> </tbody> </table>		Rate / Predefined Constant	Error %	Actual Baud Rate	BAUD_110	0.00%	110	BAUD_300	0.00%	300	BAUD_600	0.00%	600	BAUD_1200	0.00%	1200	BAUD_2400	0.04%	2401	BAUD_4800	0.04%	4802	BAUD_9600	0.16%	9615	BAUD_14400	0.27%	14439	BAUD_19200	0.38%	19273	BAUD_31250	0.00%	31250	MIDI	0.00%	31250	BAUD_38400	0.83%	38717	BAUD_56000	0.16%	56090	BAUD_57600	1.27%	58333	BAUD_115200	2.64%	118243	BAUD_128000	0.53%	128676	BAUD_256000	0.53%	257353	BAUD_300000	4.17%	312500	BAUD_375000	6.06%	397727	BAUD_500000	9.38%	546875	BAUD_600000	4.17%	625000
Rate / Predefined Constant	Error %	Actual Baud Rate																																																																		
BAUD_110	0.00%	110																																																																		
BAUD_300	0.00%	300																																																																		
BAUD_600	0.00%	600																																																																		
BAUD_1200	0.00%	1200																																																																		
BAUD_2400	0.04%	2401																																																																		
BAUD_4800	0.04%	4802																																																																		
BAUD_9600	0.16%	9615																																																																		
BAUD_14400	0.27%	14439																																																																		
BAUD_19200	0.38%	19273																																																																		
BAUD_31250	0.00%	31250																																																																		
MIDI	0.00%	31250																																																																		
BAUD_38400	0.83%	38717																																																																		
BAUD_56000	0.16%	56090																																																																		
BAUD_57600	1.27%	58333																																																																		
BAUD_115200	2.64%	118243																																																																		
BAUD_128000	0.53%	128676																																																																		
BAUD_256000	0.53%	257353																																																																		
BAUD_300000	4.17%	312500																																																																		
BAUD_375000	6.06%	397727																																																																		
BAUD_500000	9.38%	546875																																																																		
BAUD_600000	4.17%	625000																																																																		
<p>Note: Baud rates each have degree of accuracy for several reasons. The actual baud rate you would receive and relevant error% compared to the setting value, can be calculated.</p> <p>ActualBaud = 4375000/(trunc(4375000/RequiredBaud))</p> <p>Example for 115200 is, 4375000/115200 = 37.977, Truncated is 37. 4375000/37 = 118243 (rounded).</p> <p>Error% therefore is % difference between 115200 and 118243, therefore 2.64%</p> <p>It is desirable to only use a baud rate between 2 devices which has a difference of typically < 2%. Note both devices will have a degree of error, not just this 4D Processor, both need to be considered.</p>																																																																				
Example	<pre>setbaud(BAUD_19200); // To set Com0 to 19200 BAUD rate.</pre>																																																																			

2.15.2 com_SetBaud(comport, baudrate/10)

Syntax	com_SetBaud("comport", "baudrate/10");	
Arguments	comport, baudrate/10	
	comport	Com port, COM0 or COM1.
	baudrate/10	Specifies the baud rate.
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Returns True if BAUD rate was acceptable.
Description	<p>Use this function to set the required baud rate for the required Com port, COM0 or COM1. Sets to any viable baud rate from 160 to 655350.</p> <p>The default Baud Rate for COM0 is 115,200 bits per second or 115,200 baud.</p> <p>There is no default Baud Rate for COM1, setting the baud rate also activates the pins for RX and TX. Note: COM1 only exists on Pixxi-44 in Mode 2 (4-Wire SPI).</p> <p>Note: Baud Rates are not always precise, and an approximate error can be seen from the setbaud() function table on the previous page.</p> <p>Note: Several 'low' values have special meanings</p> <ul style="list-style-type: none"> 1 : 2187500 baud 2 : 1458333 baud 3 : 1093750 baud 4 : 875000 baud 5 : 729167 baud <p>Note: Baud rates each have degree of accuracy for several reasons. The actual baud rate you would receive and relevant error% compared to the setting value, can be calculated.</p> <p>ActualBaud = 4375000/(trunc(4375000/RequiredBaud))</p> <p>Example for 115200 is, 4375000/115200 = 37.977, Truncated is 37. 4375000/37 = 118243 (rounded). Error% therefore is % difference between 115200 and 118243, therefore 2.64%</p> <p>It is desirable to only use a baud rate between 2 devices which has a difference of typically < 2%. Note both devices will have a degree of error, not just this 4D Processor, both need to be considered.</p>	
Example	<pre>var stat; stat := com_SetBaud(COM0, 960); // To set Com0 to 9600 BAUD rate. if (stat) print("Com0 set to 9600 BAUD"); endif</pre>	

2.15.3 com_Mode(Databits, parity, Stopbits, comport)

Syntax	com_Mode("Databits", "parity", "Stopbits", "comport");	
Arguments	Databits, parity, Stopbits, comport	
	Databits	Specifies the number of databits, 8 is the only currently valid value
	parity	Specifies the parity bit. Valid values are N (one), E (ven) and O (dd).
	Stopbits	Specifies the number of stop bits. Valid values are 1 and 2 .
	comport	Com port, COM0 or COM1
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Returns True if the parameters were acceptable
Description	Use this function to set the required serial port parameters to other than 8N1.	
Example	<pre>stat := com_Mode(8, 'E', 2, COM0) // To set Com 0 to 8E2 if (stat) Print("Com 2 set to 8E2"); endif</pre>	

2.15.4 serin()

Syntax	serin(); or serin1();	
Arguments	none	
Returns	char	
	char	Returns: -1 if no character is available Returns: -2 if a framing error or over-run has occurred (auto cleared) Returns: positive value 0 to 255 for a valid character received
Description	serin(): Receives a character from the Serial Port COM0. serin1(): Receives a character from the Serial Port COM1. The transmission format is: No Parity, 1 Stop Bit, 8 Data Bits (N,8,1). The default Baud Rate for COM0 is 115,200 bits per second or 115,200 baud. There is no default Baud Rate for COM1, setting the baud rate also activates the pins for RX and TX. Note: COM1 only exists on Pixxi-44 in Mode 2 (4-Wire SPI) The baud rate can be changed under program control by using the setbaud(...) function.	
Example	<pre>var char; char := serin(); // test the com port if (char >= 0) // if a valid character is received process(char); // process the character endif</pre>	

2.15.5 serout(char)

Syntax	<code>serout(char); or serout1(char);</code>
Arguments	char
	char Specifies the data byte to be sent to the serial port.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	<p>serout(): Transmits a single byte from the Serial Port COM0. serout1(): Transmits a single byte from the Serial Port COM1.</p> <p>The transmission format is: No Parity, 1 Stop Bit, 8 Data Bits (N,8,1).</p> <p>The default Baud Rate for COM0 is 115,200 bits per second or 115,200 baud. There is no default Baud Rate for COM1, setting the baud rate also activates the pins for RX and TX. Note: COM1 only exists on Pixxi-44 in Mode 2 (4-Wire SPI)</p> <p>The baud rate can be changed under program control by using the setbaud(...) function.</p> <p>serout() normally blocks until the character can be transmitted, to enable serout to be non-blocking see com_TXbuffer()</p>
Example	<code>serout ('\n'); \\\Send a linefeed to COM0.</code>

2.15.6 com_Init(buffer, bufsize, qualifier)

Syntax	<code>com_Init(buffer, bufsize, qualifier); or com1_Init(buffer, bufsize, qualifier);</code>
Arguments	buffer Specifies the address of a buffer used for the background buffering service. bufsize Specifies the byte size of the user array provided for the buffer (each array element holds 2 bytes). If the buffer size is zero, a buffer of 128 words (256 bytes) should be provided for automatic packet length mode (see below). qualifier Specifies the qualifying character that must be received to initiate serial data reception and buffer write. A zero (0x00) indicates no qualifier to be used. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	<p>This is the initialisation function for the serial communications buffered service. Once initialised, the service runs in the background capturing and buffering serial data without the user application having to constantly poll the serial port. This frees up the application to service other tasks.</p> <p>MODES OF OPERATION</p> <ul style="list-style-type: none"> No <i>qualifier</i> – simple ring buffer (aka circular queue) If the qualifier is set to zero, the buffer is continually active as a simple circular queue. Characters when received from the host are placed in the circular queue (at the 'head' of the queue) Bytes may be removed from the circular queue (from the 'tail' of the queue) using the serin() function. If the tail is the same position as the head, there are no bytes in the queue, therefore serin() will return -1, meaning no character is available, also, the com_Count() function can be read at any time to determine the number of characters that are waiting between the tail and head of the queue. If the queue is not read frequently by the application, and characters are still being sent by the host, the head will eventually catch up with the tail setting the internal COM_FULL flag (which can be read with the com_Full() function) . Any further characters from the host are now discarded, however, all the characters that were buffered up to this point are readable. This is a good way of reading a fixed size packet and not necessarily considered to be an error condition. If no characters are removed from the buffer until the COM_FULL flag (which can be read with the com_Full() function) becomes set, it is guaranteed that the bytes will be ordered in the buffer from the start position, therefore, the buffer can be treated as an array and can be read directly without using serin() at all. In the latter case, the correct action is to process the data from the buffer, re-initialise the buffer with the com_Init(..) function, or reset the buffered serial service by issuing the com_Reset() function (which will return serial reception to polled mode) , and send an acknowledgement to the host (traditionally a ACK or 6) to indicate that the application is ready to receive more data and the previous 'packet' has been dealt with, or conversely, the application may send a negative acknowledgement to indicate that some sort of error occurred, or the action could not be completed (traditionally a NAK or 16) . If any low level errors occur during the buffering service (such as framing or over-run) the internal COM_ERROR flag will be set (which can be read with the com_Error() function). Note that the COM_FULL flag will remain latched to indicate that the buffer did become full, and is not reset (even if all the characters are read) until the com_Init(..) or com_Reset() function is issued. Using a qualifier If a qualifier character is specified, after the buffer is initialised with com_Init(..) , the service will ignore all characters until the qualifier is received and only then initiate the buffer write sequence with incoming data. After that point, the behaviour is the same as above for the 'non-qualified' mode.
Example	<pre>com_Init(combuf, 20, 0); // set up a comms ring buffer, maximum 12 characters before overflow</pre>

2.15.7 com_Reset()

Syntax	<code>com_Reset(); or com1_Reset();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Resets the serial communications buffered service and returns it to the default polled mode.
Example	<code>com_Reset(); // reset to polled mode</code>

2.15.8 com_Count()

Syntax	com_Count(); or com1_Count();	
Arguments	none	
Returns	count	
	count	Current count of characters in the communications buffer.
Description	This function can be read at any time (when in buffered communications is active) to determine the number of characters that are waiting in the buffer.	
Example	<pre>n := com_Count(); // get the number of chars available in the buffer</pre>	

2.15.9 com_Full()

Syntax	com_Full(); or com1_Full();
Arguments	none
Returns	status
	status Returns 1 if buffer or queue has become full, or is overflowed, else returns 0 .
Description	If the queue is not read frequently by the application, and characters are still being sent by the host, the head will eventually catch up with the tail setting the COM_FULL flag which is read with this function. If this flag is set, any further characters from the host are discarded, however, all the characters that were buffered up to this point are readable.
Example	<pre>if(com_Full() & (com_Count() == 0)) com_Init(mybuf, 30, 0); // buffer full, recovery endif</pre>

2.15.10 com_Error()

Syntax	<code>com_Error(); or com1_Error();</code>	
Arguments	<code>none</code>	
Returns	<code>status</code>	
	<code>status</code>	Returns non-zero if any low level communications error occurred bit0 = Receiver Overflow Error bit1 = Receiver Framing Error bit2 = Parity Error Overflow bit7 = Attempt to transmit when transmit is buffered and held
Description	If any low level errors occur during the buffering service (such as framing or over-run) the internal COM_ERROR flag will be set which can be read with this function.	
Example	<pre>if(com_Error()) // if there were low level comms errors, resetMySystem(); // take corrective action endif</pre>	

2.15.11 com_Sync()

Syntax	<code>com_Sync(); or com1_Sync();</code>	
Arguments	<code>none</code>	
Returns	<code>status</code>	
	<code>status</code>	Returns 1 if the qualifier character has been received, else returns 0 .
Description	If a qualifier character is specified when using buffered communications, after the buffer is initialized with <code>com_Init(..)</code> , the service will ignore all characters until the qualifier is received and only then initiate the buffer write sequence with incoming data. The <code>com_Sync()</code> function is called to determine if the qualifier character has been received yet.	
Example	<code>com_Sync(); // reset to polled mode</code>	

2.15.12 com_Txbuffer(buf, bufsize,pin)

Syntax	com_Txbuffer(buf, bufsize, pin); or com1_Txbuffer(buf, bufsize, pin);
Arguments	buf, bufsize, pin
	buf Specifies the address of a buffer used for the buffering service.
	bufsize Specifies the byte size of the user array provided for the buffer (each array element holds 2 bytes).
	pin Specifies the turnaround pin. If not required, just set "pin" to zero.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	<p>Initialise a serial buffer for the COM0 or COM1 output.</p> <p>The program must declare a var array as a circular buffer. When a TX buffer is declared for comms, the transmission of characters becomes non-blocking. The only time blocking will occur is if the buffer has insufficient space to accept the next character, in which case the function will wait for buffer space to become available. If the TX buffer is no longer required, just set the buffer pointer to zero, the size in this case doesn't matter and is ignored. The function can resize or reallocated to another buffer at any time. The buffer is flushed before any changes are made.</p> <p>"pin" designates an IO pin to control a bi-directional control device for half duplex mode. "pin" will go HI at the start of a transmission, and will return low after the final byte is transmitted.</p> <p>Once the buffer has been initialised you just continue to use serout() in the usual way, no other programming changes are required</p>
Example	<pre>com_Txbuffer(mybuf, 1024, IO1_PIN); // set the TX buffer com_Txbuffer(0, 0, 0); // revert to non buffered service</pre>

2.15.13 com_TXbufferHold(state)

Syntax	<code>com_TXbufferHold(state); or com1_TXbufferHold(state);</code>	
Arguments	state	
	state	Specifies the state of the buffer used for the buffering service.
	The arguments can be a variable, array element, expression or constant	
Returns	count	
	count	Returns buffer count when called with argument of 1, for example com_TXbufferHold(ON) Returns 0 when argument is zero, eg com_TXbufferHold(OFF)
Description	<p>This function is used in conjunction with com_TXbuffer(...).</p> <p>It is often necessary to hold off sending serial characters until a complete frame or packet has been built in the output buffer. com_TXbufferHold(ON) is used for this, to stop the buffer being sent while it is being loaded. Normally, when using buffered comms, the transmit process will begin immediately. This is fine unless you are trying to assemble a packet.</p> <p>To build a packet and send it later, issue a com_TXbufferHold(ON); build the packet, when packet is ready, issuing com_TXbufferHold(OFF); will release the buffer to the com port.</p> <p>Also, if using com_TXemptyEvent, erroneous empty events will occur as the transmit buffer is constantly trying to empty while you are busy trying to fill it.</p> <p>Also refer to the pin control for com_TXbuffer(...) function.</p> <p>Note: If you fill the buffer whilst it is held comms error 4 will be set and the data written will be lost.</p>	
Example	Refer to the com_TXemptyEvent() example.	

2.15.14 com_TXcount()

Syntax	<code>com_TXcount(); or com1_TXcount();</code>	
Arguments	<code>none</code>	
Returns	<code>count</code>	
	<code>count</code>	Returns count of characters
Description	Return count of characters remaining in COM0 or COM1 transmit buffer that was previously allocated with <code>com_TXbuffer(...)</code> or <code>com1_TXbuffer(...)</code> .	
Example	<code>arg := com1_TXCount(); //return count of characters in COM1 TX buffer</code>	

2.15.15 com_TxemptyEvent(function)

Syntax	com_TxemptyEvent(functionAddress); or com1_TxemptyEvent(functionAddress);	
Arguments	functionAddress	
	functionAddress	Address of the event Function to be queued when COM TX buffer empty
Returns	Address	
	Address	Returns any previous event function address, or zero if there was no previous function.
Description	If a comms TX buffer that was previously allocated with com_Txbuffer(...); or com1_Txbuffer(...); , this function can be used to set up a function to be called when the COM0 or COM1 TX buffer is empty. This is useful for either reloading the TX buffer, setting or clearing a pin to change the direction of eg a RS485 line driver, or any other form of traffic control. The event function must not have any parameters. To disable the event, simply call com_TxemptyEvent(0) or com1_TxemptyEvent(0) . com_Txbuffer(...); or com1_Txbuffer(...); also resets any active event.	
Example	<pre> **** * Description: buffered TX service * Use terminal at 9600 baud to see result * Example of Buffered TX service vs Non buffered * Also explains the use of COMMS events * * NB Program must be written to flash so * the Terminal can be used. * **** var combuf[220]; // buffer for up to 440 bytes // run a timer event while we are doing comms func T7Service() var private colour := 0xF800; colour ^= 0xF800; gfx_RectangleFilled(50,200,80,220,colour); sys_SetTimer(TIMER7, 200); endfunc // event to capture the buffer empty event func bufEmpty() com_Txbuffer(0, 0, IO1_PIN); // done with the buffer, release it print("\n\nHELLO WORLD, I'M EMPTY ",com_Txcount(),"\n"); endfunc func main() var n, r, D, fh; sys_SetTimerEvent(TIMER7,T7Service); // run a timer event sys_SetTimer(TIMER7, 150); com_TxemptyEvent(bufEmpty); // set to capture buffer empty event setbaud(BAUD_9600); txt_Set(TEXT_OPACITY, OPAQUE); repeat gfx_Cls(); </pre>	

```

txt_MoveCursor(3,1);           // reset cursor to line 3, column 2
print("Send 440 chars non-buffered\n");
pokeW(SYSTEM_TIMER_LO, 0);    // reset timer

// note that 440 chars at 9600 baud takes approx 453msec
for(n:=0; n<10; n++)
    to(COM0); putstr("The quick brown fox jumps over the lazy dog\n");
// 44 chars
next

print("took ",peekW(SYSTEM_TIMER_LO),"Msec\n\n");
// time spent blocking is only approx 1msec

com_TXbuffer(combuf, 440,IO1_PIN); // set up the TX buffer
com_TXbufferHold(ON);           // hold the TX buffer til ready

// note that here the time is only approx 1msec overhead due to buffering.
print("Send 440 chars buffered\n");
pokeW(SYSTEM_TIMER_LO, 0);      // reset timer

for(n:=0; n<10; n++)
    to(COM0); putstr("THE QUICK BROWN FOX JUMPS OVER THE LAZY DOG\n");
// 44 chars
next

print("took ",peekW(SYSTEM_TIMER_LO),"Msec\n\n");
// time spent blocking is only approx 1msec

// demonstrate how to modify a prepared comms buffer that is
// still being held
to(combuf); print("MY CONTENTS HAVE BEEN CHANGED");
to(combuf+50); print("*** AND CHANGED HERE TOO ***");
combuf[218] := 'CA';           // the last 'DOG' changed here
combuf[219] := 'T\n';          // the last 'DOG' changed here

// now we are ready to send to buffer
n := com_TXbufferHold(OFF);   // release TX buffer
print("TXBuffer is holding ", n, " chars\n");
// show how many characters were in the buffer

// watch the buffer empty
repeat
    print("TX count = ", [DEC5ZB] n := com_TXcount(),"\r"); // watch
the count as the buffer empties
until(!n);

print("\n\nTX Empty");

com_TXbuffer(0, 0, IO1_PIN); // done with the buffer, release it

sys_SetTimer(TIMER0, 3000); // pause for 3 seconds, non blocking
while(peekW(TMR0));

forever // do it forever
//com_TXbuffer(0, 0, 0); // if done with the pin, must release it
endfunc

```

2.15.16 com_InitBrk(buffer, bufsize, qualifier) or com1_InitBrk (buffer, bufsize, qualifier)

Syntax	<code>com_InitBrk(buffer, bufsize, qualifier);</code> or <code>com1_InitBrk(buffer, bufsize, qualifier);</code>
Arguments	buffer, bufsize, qualifier
	buffer Specifies the address of a buffer used for the background buffering service.
	bufsize Specifies the byte size of the user array provided for the buffer (each array element holds 1 byte). If the buffer size is zero, a buffer of 128 words (256 bytes) should be provided for automatic packet length mode (see below).
	qualifier Specifies the qualifying character that must be received to initiate serial data reception and buffer write. A zero (0x00) indicates no qualifier to be used.
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	This is the initialisation function for the serial communications buffered service with the ability to receive the BREAK signal as though it is a character. The parameters are identical to com_Init() except that each buffer entry can now only hold one byte. The BREAK 'character' is a predefined constant call BREAK.
Example	<code>com_InitBrk(combuf, 20, 0);</code> //set up a comms ring buffer for COM0, 10 characters before overflow

2.15.17 com_TxbufferBrk(buf, bufsize,pin) or com1_TxbufferBrk(buf, bufsize,pin)

Syntax	com_TxbufferBrk(buf, bufsize, pin); or com1_TxbufferBrk(buf, bufsize, pin);
Arguments	buf, bufsize, pin
	buf Specifies the address of a buffer used for the buffering service.
	bufsize Specifies the byte size of the user array provided for the buffer (each array element holds 1 byte).
	pin Specifies the turnaround pin. If not required, just set "pin" to zero.
	The arguments can be a variable, array element, expression or constant
Returns	None
Description	This is the initialisation function for the serial communications transmit buffered service with the ability to sent the BREAK signal as though it is a character. The parameters are identical to com_Txbuffer() except that each buffer entry can now only hold one byte. The BREAK 'character' is is a predefined constant call BREAK.
Example	com_TxbufferBrk(mybuf, 1024, PA1); // set the TX buffer of COM0 com_TxbufferBrk(0, 0, 0); // revert COM0 to non buffered service

2.16. Sound Control Functions

Summary of functions in this section:

- `snd_Volume(var)`
- `snd_Pitch(pitch)`
- `snd_BufSize(var)`
- `snd_Stop()`
- `snd_Pause()`
- `snd_Continue()`
- `snd_Playing()`
- `snd_Freq(freq, duration)`
- `snd_RTTTL(tunePtr)`

2.16.1 snd_Volume(var)

Syntax	snd_Volume(var);
Arguments	var
	var Sound playback volume
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Set the sound playback volume. Var must be in the range from 8 (min volume) to 127 (max volume). If var is less than 8, volume is set to 8, and if var > 127 it is set to 127.
Example	<code>snd_Volume(127) ; // Set Volume to maximum</code>

2.16.2 snd_Pitch(pitch)

Syntax	snd_Pitch(pitch);	
Arguments	pitch	
	pitch	Sample's playback rate. Minimum is 4KHz. Range is, 4000 – 65535.
	The arguments can be a variable, array element, expression or constant	
Returns	value	
	value	Returns sample's original sample rate.
Description	Sets the samples playback rate to a different frequency. Setting pitch to zero restores the original sample rate.	
Example	<code>snd_Pitch(7000); //Play the wav file with a sample frequency of 7KHz.</code>	

2.16.3 snd_BufSize(var)

Syntax	<code>snd_BufSize(var);</code>
Arguments	var
	var Specifies the buffer size. 0 = 1024 bytes (default) 1 = 2048 bytes 2 = 4096 bytes
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Specify the memory chunk size for the wavefile buffer, default size 1024 bytes. Depending on the sample size, memory constraints, and the sample quality, it may be beneficial to change the buffer size from the default size of 1024 bytes. This function is for control of a wav buffer, see the file_PlayWAV() function.
Example	<code>snd_BufSize(1); // allocate a 2k wav buffer</code>

2.16.4 snd_Stop()

Syntax	<code>snd_Stop();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Stop any sound that is currently playing, releasing buffers and closing any open wav file. This function is for control of a wav buffer, see the file_PlayWAV() function.
Example	<code>snd_Stop();</code>

2.16.5 snd_Pause()

Syntax	<code>snd_Pause();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Pause any sound that is currently playing. This function is for control of a wav buffer, see the file_PlayWAV() function.
Example	<code>snd_Pause();</code>

2.16.6 snd_Continue()

Syntax	<code>snd_Continue();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Resume any sound that is currently paused by <code>snd_Pause</code> . This function is for control of a wav buffer, see the <code>file_PlayWAV()</code> function.
Example	<code>snd_Continue();</code>

2.16.7 snd_Playing()

Syntax	snd_Playing();	
Arguments	none	
Returns	value	
	value	Number of 512 byte blocks to go.
Description	Returns 0 if sound has finished playing, else return number of 512 byte blocks to go. This function is for control of a wav buffer, see the file_PlayWAV() function.	
Example	<code>count := snd_Playing();</code>	

2.16.8 snd_Freq(freq, duration)

Syntax	<code>snd_Freq(freq, duration);</code>	
Arguments	freq, duration	
	freq	The frequency of the sound to produce, 20Hz is the minimum.
	duration	The duration of the sound in milliseconds.
Returns	status	
	status	Returns 0 if note cannot be played because a frequency is playing, else returns True.
Description	Produces a pure square wave waveform. This command is designed to drive Piezo transducers which require this sort of input. It can be used directly with high impedance speakers. Whilst it also works on displays with a built-in amplifier the sound produced is extremely annoying.	
Example	<code>snd_Freq(2731, 100); // produce a 100ms burst at the Piezo's resonant frequency.</code>	

2.16.9 snd_RTTTL(tunePtr)

Syntax	<code>snd_RTTTL(tunePtr);</code>				
Arguments	<table border="1"> <tr> <td><code>tuneptr</code></td><td>Specifies a pointer to a data statement or a string constant containing RTTTL information. Note: The argument passed to the <code>snd_RTTTL (...)</code> function must be an ASCII string. If the string is passed as a pointer from a #DATA statement, it must be terminated with a zero (0x00). If a string is passed directly as a parameter, the '0' is automatically appended by the compiler as per normal strings.</td></tr> <tr> <td></td><td>The arguments can be a variable, array element, expression or constant</td></tr> </table>	<code>tuneptr</code>	Specifies a pointer to a data statement or a string constant containing RTTTL information. Note: The argument passed to the <code>snd_RTTTL (...)</code> function must be an ASCII string. If the string is passed as a pointer from a #DATA statement, it must be terminated with a zero (0x00). If a string is passed directly as a parameter, the '0' is automatically appended by the compiler as per normal strings.		The arguments can be a variable, array element, expression or constant
<code>tuneptr</code>	Specifies a pointer to a data statement or a string constant containing RTTTL information. Note: The argument passed to the <code>snd_RTTTL (...)</code> function must be an ASCII string. If the string is passed as a pointer from a #DATA statement, it must be terminated with a zero (0x00). If a string is passed directly as a parameter, the '0' is automatically appended by the compiler as per normal strings.				
	The arguments can be a variable, array element, expression or constant				
Returns	<code>nothing</code>				
Description	<p>This function uses the "Ring Tone Text Transfer Language" (RTTTL) developed by Nokia for cellphone ring tones. There are certain differences that need to be taken into account, and several additions that will be described later. It is recommended to check the original format first, with the suggested references located at:</p> <p>http://www.activexperts.com/xmstoolkit/sms/rtttl/ and http://en.wikipedia.org/wiki/Ring_Tone_Transfer_Language</p> <p>With little practice and minor modifications, most RTTTL tunes that can be downloaded off the web are playable with this function. Also, a wide range of sound effects can be made using standard RTTTL notation augmented with the additional 4DGL functions.</p>				
Example	<pre>/* This example shows how to use the RTTTL tunes to generate complex sounds and music. */ //----- #DATA // b=250 byte Muppets "d=4,o=5,b=15,", "c6,c6,a,b,8a,b,g,p,c6,c6,a,8b,8a,8p,g.,p,e,e,g,f, 8e,f,8c6,8c,8d,e,8e,8p,8e,g,2p,c6,", "c6,a,b,8a,b,g,p,c6,c6,a,8b,a,g.,p,e,e,g,f,8e,f, 8c6,8c,8d,e,8e,d,8d,c",0 // part of haunted house theme byte HauntedHouse "d=4,o=5,b=20,", "2a4,2e,2d#,2b4,2a4,2c,2d,2a#4,2e.,e,1f4,1a4, 1d#,2e.,d,2c.,b4,1a4", 0 // simple scale with default settings byte SimpleScale "c,d,e,f,g,a,b,c7", 0 // simple scale with default settings and portamento use. // Note the portamento speed change in the middle of the string, // and the curly braces that turn the portamento on and off. byte SimpleScaleP "b=50,{,c,d,e,f,p=7,g,a,},b,c7", 0 // simple scale, much faster</pre>				

```

// note b=20 as default, so each note plays for 20msec when d=64
byte Scale2          "d=64,c,d,e,f,g,a,b,c7", 0

// simple scale, much faster - with a repeat command set to 20
// note b=20 as default, so each note plays for 20msec when d=64,

2.17. SPI Control Functions

General purpose SPI functions. To be used only when the uSD card is not active. Summary of functions in this section:

- `spi_Init(speed, input_mode, output_mode)`
- `spi_Read()`
- `spi_Write(byte)`
- `spi_Disable()`

2.17.1 spi_Init(speed, input_mode, output_mode)

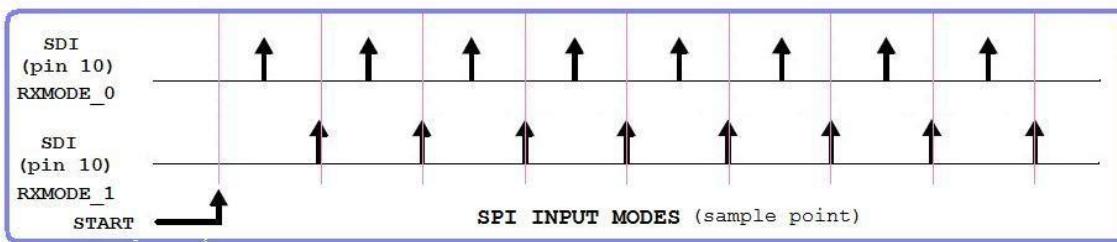

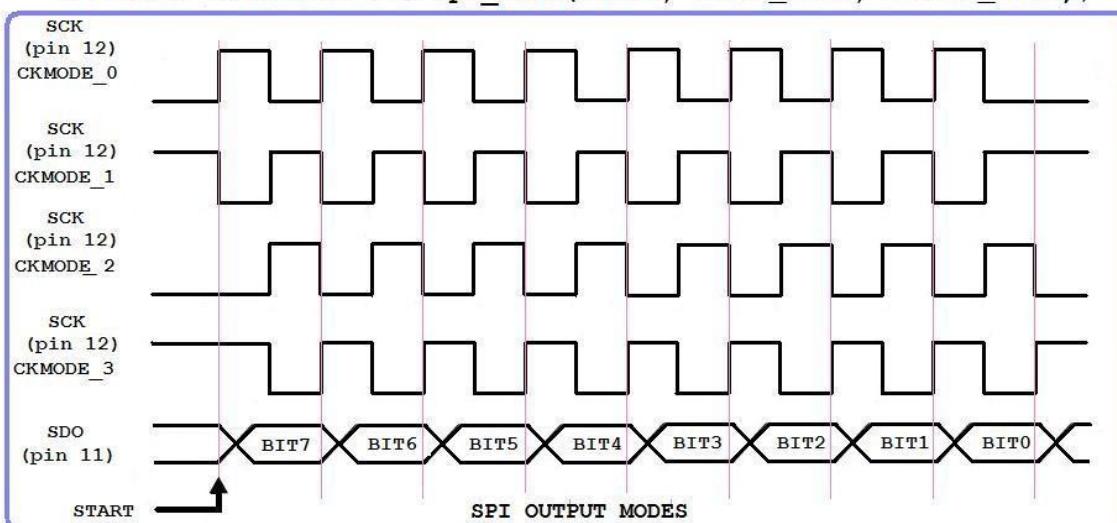

Syntax	<code>spi_Init(speed, input_mode, output_mode);</code>	
Arguments	speed, input_mode, output_mode	
	speed	Sets the speed of the SPI port.
	input_mode	Sets the input mode of the SPI port. See diagram below.
	output_mode	Sets the output mode of the SPI port. See diagram below.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	<p>Sets up the processor SPI port to communicate with SPI devices. See the example in section spi_Read().</p> <p>This is not for communicating to SPI Flash or microSD card for media related functions. This is for applications where SPI Flash or microSD card are not present, and another SPI Device is connected instead.</p>	
Example	<code>spi_Init(SPI_FAST, RXMODE_0, CKMODE_0);</code>	

Note: The SPI functions in this section are not necessary when using the memory card or serial flash chips interfaced to the SPI port. Refer to `file_Mount()` and `media_Init()` for memory/flash based requirements.

The SPI functions in this section are relevant to those devices **other than** the memory card and the serial flash chip used for media access. This is relevant in cases where Flash Memory or uSD card is not present, and the SPI port on PIXXI is used for another SPI device.

PIXXI Graphics Processors – Internal Functions

SPI MODE ARGUMENTS FOR `spi_Init(SPEED, INPUT_MODE, OUTPUT_MODE);`

<code>spi_Init (SPI SPEED ,</code>	<code>SPI INPUT MODE ,</code>	<code>SPI OUTPUT MODE);</code>
0 SPI_SLOW(750khz)	0 RXMODE_0	0 CKMODE_0
1 SMI_MED (3mhz)	1 RXMODE_1	1 CKMODE_1
2 SPI_FAST(12mhz)		2 CKMODE_2
		3 CKMODE_3

2.17.2 spi_Read()

Syntax	spi_Read();	
Arguments	none	
Returns	byte byte Returns a single data byte from the SPI device.	
Description	This function allows a raw unadorned byte read from the SPI device. Note: The Chip Select line (SDCS) is lowered automatically.	
Example	<pre>var result; spi_Init(SPI_SPEED0, RXMODE_0, CKMODE_0); print("Hello World\n") ; // replace with your code //... spi_Write(0x40); // x_Accel Request result := spi_Read(); print("result: ", result);</pre>	

2.17.3 spi_Write(byte)

Syntax	<code>spi_Write(byte);</code>
Arguments	byte <code>byte</code> Specifies the data byte to be sent to the SPI device. The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	This function allows a raw unadorned byte write to the SPI device. Note: The Chip Select line (SDCS) is lowered automatically.
Example	See the example in section spi_Read() .

2.17.4 spi_Disable()

Syntax	<code>spi_Disable();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	This function raises the Chip Select (SDCS) line of the SPI device, disabling it from further activity. The CS line will be automatically lowered next time the SPI functions <code>spi_Read()</code> or <code>spi_Write()</code> are used, and also by action of any of the media functions.

2.18. String Class Functions

Summary of functions in this section:

- str_Ptr(&var)
- str_GetD(&ptr, &var)
- str_GetW(&ptr, &var)
- str_GetHexW(&ptr, &var)
- str_GetC(&ptr, &var)
- str_GetByte(ptr)
- str_GetWord(ptr)
- str_PutByte(ptr, val)
- str_PutWord(ptr, val)
- str_Match(&ptr, *str)
- str_MatchI(&ptr, *str)
- str_Find(&ptr, *str)
- str_FindI(&ptr, *str)
- str_Length(ptr)
- str_Printf(&ptr, *format)
- str_Cat(&destination, &source)
- str_CatN(&ptr, str, count)
- str_ByteMove(src, dest, count)
- str_Copy(dest, src)
- str_CopyN(dest, src, count)

2.18.1 str_Ptr(&var)

Syntax	str_Ptr(&var);	
Arguments	var	
	var	Pointer to string buffer
Returns	pointer	
	pointer	Returned value is the byte pointer to string buffer.
Description	Return a byte pointer to a word region.	
Example	<pre>var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var vars[3]; // for our results func main() to(buffer); print("0x1234 0b10011001 12345 abacus"); p := str_Ptr(buffer); //raise string pointer for the string functions while(str_GetW(&p, &vars[n++]) != 0); // read all the numbers till we //get a non number print(vars[0], "\n", vars[1], "\n", vars[2], "\n"); // print them out endfunc</pre>	

2.18.2 str_GetD(&ptr, &var)

Syntax	str_GetD(&ptr, &var);	
Arguments	&ptr, &var	
	ptr	Byte pointer to string
	var	Destination for result
Returns	status	
	status	Returns TRUE if function succeeds, advancing ptr
Description	Convert number in a string to DWORD (myvar[2]). NB:- The address of the pointer must be passed so the function can advance it if required.	
Example	<pre>var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var vars[6]; // for our results func main() to(buffer); print("100000 200000 98765432 abacus"); p := str_Ptr(buffer); // raise a string pointer so we can use the // string functions while(str_GetD(&p, &vars[n]) != 0) n:=n+2; //read all the numbers //till we get a non number print([HEX4] vars[1], ":" , [HEX4] vars[0], "\n"); // show the longs as hex numbers print([HEX4] vars[3], ":" , [HEX4] vars[2], "\n"); print([HEX4] vars[5], ":" , [HEX4] vars[4], "\n"); endfunc</pre>	

2.18.3 str_GetW(&ptr, &var)

Syntax	str_GetW(&ptr, &var);	
Arguments	&ptr, &var	
	ptr	Byte pointer to string
	var	Destination for result
Returns	Status	
	Status	Returns TRUE if function succeeds, advancing ptr.
Description	Convert number in a string to WORD (myvar). NB:- The address of the pointer must be passed so the function can advance it if required.	
Example	<pre>var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var vars[3]; // for our results func main() to(buffer); print("0x1234 0b10011001 12345 abacus"); p := str_Ptr(buffer); // raise a string pointer so we can use the // string functions while(str_GetW(&p, &vars[n++]) != 0); // read all the numbers till // we get a non number print(vars[0], "\n", vars[1], "\n", vars[2], "\n"); // print them out str_Printf (&p, "%s\n"); // numbers extracted, now just print // remainder of string endfunc</pre>	

2.18.4 str_GetHexW(&ptr, &var)

Syntax	str_GetHexW(&ptr, &var);	
Arguments	&ptr, &var	
	ptr	Byte pointer to string
	var	Destination for result
Returns	status	
	status	Returns TRUE if function succeeds, advancing ptr
Description	Convert hex number in a string to WORD (myvar). This function is for extracting 'raw' hex words with no "0x" prefix. Note: The address of the pointer must be passed so the function can advance it if required.	
Example	<pre>var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var vars[4]; // for our results func main() to(buffer); print("1234 5678 9 ABCD"); p := str_Ptr(buffer); // raise a string pointer so we can use the // string functions while(str_GetHexW(&p, &vars[n++]) != 0); // read all the hex numbers // till we get a non number print(vars[0], "\n", vars[1], "\n", vars[2], "\n", vars[3], "\n"); endfunc</pre>	

2.18.5 str_GetC(&ptr, &var)

Syntax	str_GetC(&ptr, &var);	
Arguments	&ptr, &var	
	ptr	Byte pointer to string
	var	Destination for our result
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Returns TRUE if function succeeds, advancing ptr.
Description	Get next valid ascii char in a string to myvar. NB:- The address of the pointer must be passed so the function can advance it if required. The function returns 0 if end of string reached. Used for extracting single characters from a string.	
Example	<pre>var p; // string pointer var n; var char; var buffer[100]; // 200 character buffer for a source string func main() to(buffer); print("Quick Brown Fox"); p := str_Ptr(buffer); // raise a string pointer so we can use the //string functions while(str_GetC(&p, &char)) print("p=",p," char is", [CHR] char); // print characters wend print("End of string"); endfunc</pre>	

2.18.6 str_GetByte(ptr)

Syntax	str_GetByte(ptr);	
Arguments	ptr	
	ptr	Address of byte array or string
Returns	byte	
	byte	Returns the byte value at pointer location
Description	Get a byte to myvar. Similar to "PEEKB" in basic. It is not necessary for byte pointer ptr to be word aligned	
Example	<pre>var buffer[100]; // 200 character buffer for a source string var n, p; func main() to(buffer); print("Testing 1 2 3"); p := str_Ptr(buffer); // get a byte pointer from a word region n := 0; while (n <= str_Length(buffer)) print([HEX2] str_GetByte(p + n++), " "); // print all the chars hex // values wend endfunc</pre>	

2.18.7 str_GetWord(ptr)

Syntax	str_GetWord(ptr);	
Arguments	ptr	
	ptr	Byte pointer
Returns	word	
	word	Returns the word at pointer location
Description	Get a word to myvar. Similar to PEEKW in basic. It is not necessary for byte pointer ptr to be word aligned	
Example	<pre>var p; // string pointer var buffer[10]; // array for 20 bytes func main() p := str_Ptr (buffer); // raise a string pointer str_PutWord (p+3, 100); // 'poke' the array str_PutWord (p+9, 200); str_PutWord (p+12, 400); print(str_GetWord(p + 3), "\n"); // 'peek' the array print(str_GetWord(p + 9), "\n"); print(str_GetWord(p + 12), "\n"); endfunc</pre>	

2.18.8 str_PutByte(ptr, val)

Syntax	str_PutByte(ptr, val);	
Arguments	ptr, val	
	ptr	Byte pointer to string
	val	Byte value to insert
Returns	nothing	
Description	Put a byte value into a string buffer at ptr Similar to "POKEB" in basic It is not necessary for byte pointer ptr to be word aligned	
Example	<pre> var buffer[100]; // 200 character buffer for a source string var p; // string pointer func main() p := str_Ptr(buffer); // raise a string pointer so we can use the // string functions str_PutByte(p + 3, 'A'); // store some values str_PutByte(p + 4, 'B'); // store some values str_PutByte(p + 5, 'C'); // store some values str_PutByte(p + 7, 'D'); // store some values str_PutByte(p + 7, 0); // string terminator fprintf(vars[0],"\\n", vars[1],"\\n", vars[2],"\\n"); // print them out p := p + 3; // offset to where we placed the chars fprintf(&p, "%s\\n"); // print the result // nb, also, understand that the core print service // assumes a word aligned address so it starts at pos 4 // print([STR] &buffer[2]); endfunc </pre>	

2.18.9 str_PutWord(ptr, val)

Syntax	str_PutWord(ptr, val);	
Arguments	ptr, val	
	ptr	Byte pointer
	val	Value to store
Returns	nothing	
Description	Put a word value into a byte buffer at ptr, similar to "POKEW" in basic. It is not necessary for byte pointer ptr to be word aligned	
Example	<pre>var p; // string pointer var numbers[10]; // array for 20 bytes func main() p := str_Ptr (numbers); // raise a string pointer str_PutWord (p+3, 100); // 'poke' the array with some numbers str_PutWord (p+9, 200); str_PutWord (p+12, 400); print(str_GetWord(p + 3), "\n"); // 'peek' the array print(str_GetWord(p + 9), "\n"); print(str_GetWord(p + 12), "\n"); endfunc</pre>	

2.18.10 str_Match(&ptr, *str)

Syntax	str_Match(&ptr, *str);	
Arguments	ptr, str	
	ptr	Address of byte pointer to string buffer
	str	Pointer string to match
Returns	value	
	value	Returns 0 if no match, else advance ptr to the next position after the match and returns a pointer to the match position.
Description	Case Sensitive match. Compares the string at position ptr in a string buffer to the string str, skipping over any leading spaces if required. If a match occurs, ptr is advanced to the first position past the match, else ptr is not altered. NB:- The address of the pointer must be passed so the function can advance it if required.	
Example	<pre> var buffer[100]; // 200 character buffer for a source string var p, q; // string pointers var n; func main() to(buffer); print(" volts 240 "); // string to parse p := str_Ptr(buffer); // string pointer to be used // with string functions q := p; // match the start of the string with "volts" if (n := str_Match(&p, "volts")) str_Printf (&p, "%s\n"); // print remainder of string else print ("not found\n"); endif print ("startpos=" , q , "\nfindpos=" , n , "\nendpos=" , p); repeat forever endfunc </pre>	

2.18.11 str_MatchI(&ptr, *str)

Syntax	str_MatchI(&ptr, *str);	
Arguments	ptr, str	
	ptr	Address of byte pointer to string buffer
	str	Pointer string to match
Returns	value	
	value	Returns 0 if no match, else advance ptr to the next position after the match and returns a pointer to the match position
Description	Case Insensitive match. Compares the string at position ptr in a string buffer to the string str, skipping over any leading spaces if required. If a match occurs, ptr is advanced to the first position past the match, else ptr is not altered. NB:- The address of the pointer must be passed so the function can advance it if required.	
Example	<pre> var buffer[100]; // 200 character buffer for a source string var p, q; // string pointers var n; func main() // string to parse to(buffer); print("The sun rises in the East"); p := str_Ptr(buffer); // string pointer to be used // with string functions q := p; // Will match if the string starts with "The", or "the" if (n := str_MatchI(&p, "the")) str_Printf (&p, "%s\n"); // print remainder of string else print ("not found\n"); endif print ("startpos=" , q , "\nfindpos=" , n , "\nendpos=" , p); repeat forever endfunc </pre>	

2.18.12 str_Find(&ptr, *str)

Syntax	str_Find(&ptr, *str);	
Arguments	ptr, str	
	ptr	Byte pointer to string buffer
	str	String to find
Returns	value	
	value	Returns 0 if not found. Returns the position of the find if successful.
Description	Case Sensitive. Searches for string str in string buffer pointed to by ptr. NB:- The pointer ptr is not altered.	
Example	<pre> var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var strings[4]; // for our test strings func main() txt_Set (FONT_ID, FONT2); strings[0] := "useful" ; strings[1] := "string" ; strings[2] := "way" ; strings[3] := "class" ; to(buffer); print ("and by the way, the string class is rather useful "); // raise a string pointer so we can use the string functions p := str_Ptr(buffer); // offset into the buffer a little so we don't see word "way" p := p + 13; print("p=" , p , "\n\n"); // show the start point of our search n := 0; while (n < 4) print("\"", [STR] strings[n] , "\" is at pos " , str_Find(&p , strings[n++]) , "\n"); wend //note that p is unchanged print ("\nNOTE: p is unchanged, p=" , p); repeat forever endfunc </pre>	

2.18.13 str_FindI(&ptr, *str)

Syntax	str_FindI(&ptr, *str);	
Arguments	ptr, str	
	ptr	Byte pointer to string buffer
	str	String to find
Returns	value	
	value	Returns 0 if not found. Returns the position of the find if successful.
Description	Case Insensitive. Searches for string str in string buffer pointed to by ptr. NB:- The pointer ptr is not altered.	
Example	<pre> var buffer[100]; // 200 character buffer for a source string var p; // string pointer var n; var strings[4]; // for our test strings func main() txt_Set (FONT_ID, FONT2); strings[0] := "USEFUL" ; strings[1] := "string" ; strings[2] := "way" ; strings[3] := "class" ; to(buffer); print ("and by the way, the String Class is rather useful "); // raise a string pointer so we can use the string functions p := str_Ptr(buffer); // offset into the buffer a little so we don't see word "way" p := p + 13; // show the start point of our search print("p=" , p , "\n\n"); n := 0; while (n < 4) print("" , [STR] strings[n] , "\" is at pos " , str_FindI (&p , strings[n++]) , "\n"); wend //note that p is unchanged print ("\nNOTE: p is unchanged, p=" , p); repeat forever endfunc </pre>	

2.18.14 str_Length(ptr)

Syntax	str_Length(ptr);	
Arguments	ptr	
	ptr	pointer to string buffer
Returns	value	
	value	Returns string length
Description	Returns the length of a string excluding terminator.	
Example	<pre> var a; var b; var c[40]; // 80 character buffer for a source string var pa, pc; //These will be String pointers to a and c[] func main() a := mem_Alloc(200); // allocate a dynamic buffer full of random data mem_Set (a, 'X', 200); // fill it full of 'X's pa := str_Ptr(a); // raise a string pointer str_PutByte(pa+20,0); //Now stick a string terminator in the array //Change the 20 to be between 0 and 199 b := "A string constant" ; // b is a pointer to a string constant to (c); print ("An 'ASCIIIZ' string is terminated with a zero"); pc := str_Ptr(c); // raise a string pointer so we can use the // string functions print ("a length:", str_Length(pa), "\n"); // show length of the // dynamic buffer print ("b length:", str_Length(b), "\n"); // show length of the // static string print ("c length:", str_Length(pc), "\n"); // show length of the // 're-directed' string mem_Free (a); // test is over, free up the memory repeat forever endfunc </pre>	

2.18.15 str_Printf(&ptr, *format)

Syntax	<code>str_Printf(&ptr, *format);</code>																							
Arguments	ptr, format																							
	ptr	Byte pointer to the input data (structure).																						
	format	<p>Format string. Note: The address of the pointer must be passed so the function can advance it as required.</p> <p>Note: The format specifier string can be a string pointer, allowing dynamic construction of the printing format.</p> <p>Format Specifiers:</p> <table> <tr><td>%c</td><td>character</td></tr> <tr><td>%s</td><td>string of characters</td></tr> <tr><td>%d</td><td>signed decimal</td></tr> <tr><td>%ld</td><td>long decimal</td></tr> <tr><td>%u</td><td>unsigned decimal</td></tr> <tr><td>%lu</td><td>long unsigned decimal</td></tr> <tr><td>%x</td><td>hex byte</td></tr> <tr><td>%X</td><td>hex word</td></tr> <tr><td>%lX</td><td>hex long</td></tr> <tr><td>%b</td><td>binary word</td></tr> <tr><td>%lb</td><td>long binary word</td></tr> </table> <p>* indirection prefix (placed after '%' to specify indirect addressing)</p> <p>(number) width description (use between '%' and format specifier to set the field width).</p> <p>Note: If (number) is preceded by 0, the result is Left-pads with zeroes (0) instead of spaces.</p>	%c	character	%s	string of characters	%d	signed decimal	%ld	long decimal	%u	unsigned decimal	%lu	long unsigned decimal	%x	hex byte	%X	hex word	%lX	hex long	%b	binary word	%lb	long binary word
%c	character																							
%s	string of characters																							
%d	signed decimal																							
%ld	long decimal																							
%u	unsigned decimal																							
%lu	long unsigned decimal																							
%x	hex byte																							
%X	hex word																							
%lX	hex long																							
%b	binary word																							
%lb	long binary word																							
Returns	pointer																							
	pointer	Returns the position of last extraction point. This is useful for processing by other string functions.																						
Description	This function prints a formatted string from elements derived from a structured byte region. There is only one input argument, the byte region pointer ptr which is automatically advanced as the format specifier string is processed. The format string is similar to the C language, however, there are a few differences, including the addition of the indirection token * (asterix).																							
Example	<pre>var buffer[100]; // 200 character buffer for a source string var p, q; // string pointers var n; var m[20]; // for our structure example var format; // a pointer to a format string func main() var k; // string print example to (buffer); print ("\nHELLO WORLD");</pre>																							

```
q := str_Ptr (buffer); // raise a string pointer so we can use the
                      // string functions
p := q;
str_Printf ( &p , "%8s" ); // only prints first 8 characters of
                          // string

putch ('\n');           // new line

p := q;
k := str_Printf ( &p , "%04s" ); // prints 4 leading spaces before
                                // string

putch ('\n');           // new line
print ( k );            // if required, the return value points to the last
                        // source position and is returned for processing by
                        // other string functions

// print structure elements example, make a demo structure

n := 0;
m[n++] := "Mrs Smith" ;
m[n++] := 200 ;
m[n++] := 300 ;
m[n++] := 0xAA55 ;
m[n++] := 500 ;

// make a demo format control string

format := "%*s\n%d\n%d\n%016b\n%04X" ; // format string for printing
                                         // structure m

// print the structure in the required format

p := str_Ptr (m);          // point to structure m
str_Printf (&p, format);   // use the format string to print the
                           // structure

endfunc
```

2.18.16 str_Cat(&destination, &source)

Syntax	str_Cat(&destination, &source);
Arguments	destination, source
	destination Destination string address
	source Source string address
Returns	pointer
	pointer Returns pointer to the destination.
Description	Appends a copy of the source string to the destination string. The terminating null character in destination is overwritten by the first character of source, and a new null-character is appended at the end of the new string formed by the concatenation of both in destination.
Example	<pre>var buf[100]; // 200 character buffer for a source string func main() var p ; to(buf) ; print("Hello ") ; p := str_Ptr(buf) ; str_Cat(p,"There"); // Will append "There" to the end of buf print([STR] buf) ; repeat forever endfunc</pre>

2.18.17 str_CatN(&ptr, str, count)

Syntax	str_CatN(&ptr, str, count);	
Arguments	ptr, str, count	
	ptr	Destination string address
	str	Source string address
	count	Number of characters to be concatenated
Returns	pointer	
	pointer	Returns pointer to the destination.
Description	<p>The number of characters copied is limited by "count". The terminating null character in destination is overwritten by the first character of source, and a new null-character is appended at the end of the new string formed by the concatenation of both in destination.</p>	
Example	<pre>var buf[100]; // 200 character buffer for a source string func main() var p ; to(buf) ; print("Sun ") ; p := str_Ptr(buf) ; str_CatN(p,"Monday",3); // Concatenate "Mon" to the end of buf print([STR] buf) ; repeat forever endfunc</pre>	

2.18.18 str_ByteMove(src, dest, count)

Syntax	str_ByteMove(src, dest, count);	
Arguments	src, dest, count	
	src	Points to byte aligned source
	dest	Points to byte aligned destination
	count	Number of bytes to transfer
Returns	pointer	
	pointer	Returns a pointer to the end of the destination (which is "dest" + "count").
Description	Copy bytes from "src" to "dest", stopping only when "count" is exhausted. No terminator is appended, it is purely a byte copy, and any zeroes encountered will also be copied.	
Example	<pre>var src, dest, mybuf1[10], mybuf2[10]; // string pointers and two 20 byte buffers to(mybuf1); putstr("TESTING 123"); src := strPtr(mybuf1); dest := str_Ptr(mybuf2); src += 6; // move src pointer to "G 123" str_ByteMove(src, dest, 6); // move to second buffer (including the zero terminator) putstr(mybuf2); // print result nextpos := str_ByteMove(s, d, 100);</pre>	

2.18.19 str_Copy(dest, src)

Syntax	str_Copy(dest, src);	
Arguments	dest, src	
	dest	Points to byte aligned destination
	src	Points to byte aligned source
Returns	pointer	
	pointer	Returns a pointer to the 0x00 string terminator at the end of "dest" (which is "dest" + str_Length(src);).
Description	Copy a string from "src" to "dest", stopping only when the end of source string "src" is encountered (0x00 terminator). The terminator is always appended, even if "src" is an empty string.	
Example	<code>nextplace := str_Copy(d, s);</code>	

2.18.20 str_CopyN(dest, src, count)

Syntax	<code>str_CopyN(dest, src, count);</code>	
Arguments	dest, src, count	
	dest	Points to byte aligned destination
	src	Points to byte aligned source
	count	Maximum number of bytes to copy
Returns	pointer	
	pointer	Returns a pointer to the 0x00 string terminator at the end of " dest " (which is "dest" + str_Length(src);).
Description	Copy a string from " src " to " dest ", stopping only when " count " is exhausted, or end of source string " src " is encountered (0x00 string terminator). The terminator is always appended, even if " count " is zero, or " src " is a null string.	
Example	<code>nextplace := str_CopyN(d, s, 100);</code>	

2.19. System Memory Access Functions

Summary of functions in this section:

- peekW(address)
- pokeW(address, word_value)

2.19.1 peekW(address)

Syntax	peekW(address);	
Arguments	address	
	address	The address of a memory word. The address is usually a pre-defined system register address constant. See the address constants for all the system word sized registers in section System Registers Memory Map .
		The arguments can be a variable, array element, expression or constant.
Returns	word_value	
	word_value	The 16 bit value stored at address .
Description	This function returns the 16 bit value that is stored at address .	
Example	<pre>var myvar; myvar := peekW(SYSTEM_TIMER_LO);</pre>	
	This example places the low word of the 32 bit system timer in myvar .	

2.19.2 pokeW(address, word_value)

Syntax	<code>pokeW(address, word_value);</code>	
Arguments	address, word_value	
address	The address of a memory word. The address is usually a pre-defined system register address constant. See the address constants for all the system word sized registers in section System Registers Memory Map .	
	word_value	The 16 bit word_value will be stored at address .
The arguments can be a variable, array element, expression or constant.		
Returns	boolean	
	boolean	Returns TRUE if poke address was a legal address (usually ignored).
Description	This function writes a 16 bit value to a location specified by address .	
Example	<code>pokeW(TIMER2, 5000);</code>	
	This example sets TIMER2 to 5 seconds.	

2.20. Text and String Functions

Summary of functions in this section:

- txt_MoveCursor(line, column)
- putch(char)
- putstr(pointer)
- putstrCentred(xc, yc, string)
- putnum(format, value)
- print(...)
- to(outstream)
- charwidth('char')
- charheight('char')
- strwidth(pointer)
- strheight()
- strlen(pointer)
- txt_Set(function, value)
- txt_Set shortcuts:
 - txt_FGcolour(colour)
 - txt_BGcolour(colour)
 - txt_FontID(id)
 - txt_Width(multiplier)
 - txt_Height(multiplier)
 - txt_Xgap(pixelcount)
 - txt_Ygap(pixelcount)
 - txt_Delay(milliseconds)
 - txt_Opacity(mode)
 - txt_Bold(mode)
 - txt_Italic(mode)
 - txt_Inverse(mode)
 - txt_Underlined(mode)
 - txt_Attributes(value)
 - txt_Wrap(value)

2.20.1 txt_MoveCursor(line, column)

Syntax	txt_MoveCursor(line, column);	
Arguments	line, column	
	line	Holds a positive value for the required line position.
	column	Holds a positive value for the required column position.
	The arguments can be a variable, array element, expression or constant	
Returns	nothing	
Description	Moves the text cursor to a screen position set by line and column parameters. The line and column position are calculated, based on the size and scaling factor for the currently selected font. When text is outputted to screen it will be displayed from this position. The text position could also be set with gfx_MoveTo(...) if required to set the text position to an exact pixel location. Note that lines and columns start from 0, so line 0, column 0 is the top left corner of the display.	
Example	<pre>txt_MoveCursor(4, 9);</pre> This example moves the text origin to the 5 th line and the 10 th column.	

2.20.2 putch(char)

Syntax	putch(char);	
Arguments	char	
	char	Holds a positive value for the required character.
		The arguments can be a variable, array element, expression or constant
Returns	nothing	
Description	This function prints single characters to the current output stream, usually the display.	
Example	<pre>var v; v := 0x39; putch(v); // print the number 9 to the current display location putch('\n'); // newline</pre>	

2.20.3 putstr(pointer)

Syntax	putstr(pointer);	
Arguments	pointer	
	pointer	A string constant or pointer to a string.
		The argument can be a string constant or pointer to a string, a pointer to an array, or a pointer to a data statement.
Returns	source	
	source	Returns the pointer to the item that was printed.
Description	<p>This function prints a string to the current output stream, usually the display. The argument can be a string constant, a pointer to a string, a pointer to an array, or a pointer to a data statement.</p> <p>The output of putstr can be redirected to the communications port, the media, or memory using the to(...) function.</p> <p>A string constant is automatically terminated with a zero.</p> <p>A string in a data statement is not automatically terminated with a zero.</p> <p>All variables in 4DGL are 16-bit, if an array is used for holding 8-bit characters, each array element packs 1 or 2 characters.</p> <p>Note: putstr is more efficient than print for printing single strings.</p>	
Example	<pre>//===== // Example #1 - print a string constant //===== putstr("HELLO\n"); //simply print a string constant at current origin //===== // Example #2 - print string via pointer //===== var p; // a var for use as a pointer p := "String Constant\n"; // assign a string constant to pointer putstr(p); // print the string using the pointer putstr(p+8); // print, offsetting into the string //===== // Example #3 - printing strings from data table //===== #DATA byte message "Week\n",0 word days sun,mon,tue,wed,thu,fri,sat // pointers to data items byte sun "Sunday\n\0" byte mon "Monday\n\0" byte tue "Tuesday\n\0" byte wed "Wednesday\n\0" byte thu "Thursday\n\0" byte fri "Friday\n\0" byte sat "Saturday\n\0" #END</pre>	

```
var n;
putstr(message);
n:=0;
while(n < 7)
    putstr(days[n++]); // print the days
wend
```

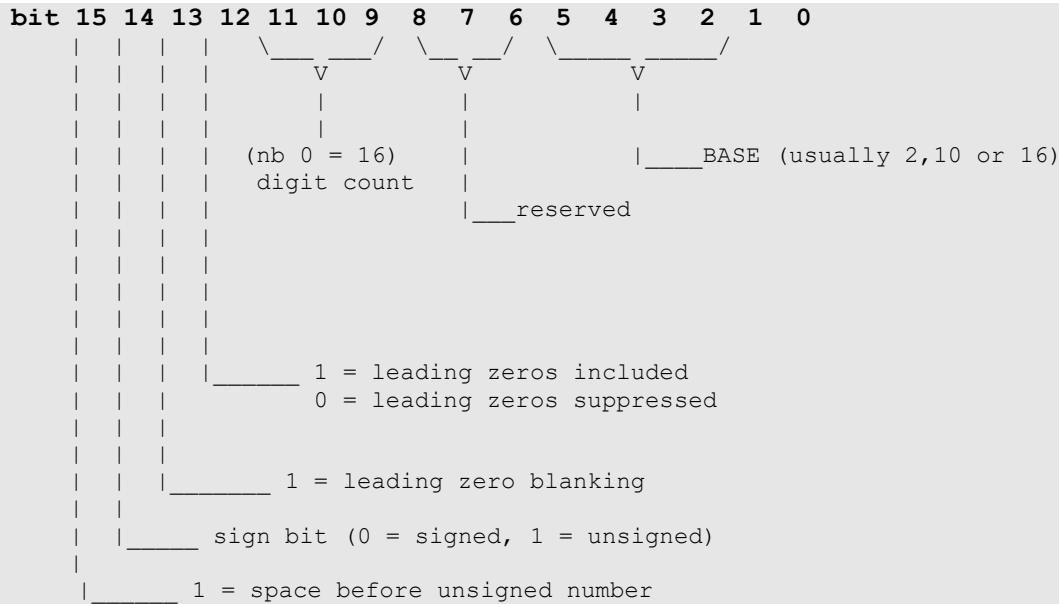

2.20.4 putstrCentred(xc, yc, string)

Syntax	putstrCentred(xc, yc, string)
Arguments	xc, yc, string
	xc Specifies the X-coordinate of the centre.
	yc Specifies the Y-coordinate of the centre.
	string A string constant or pointer to a string.
	The argument can be a string constant, or pointer to a word aligned string.
Returns	nothing
Description	This function prints a string centred at position xc, yc.
Example	<code>putstrCentred(100, 100, "HELLO"); // print "HELLO" centered at 100,100</code>

2.20.5 putnum(format, value)

Syntax	putnum(format, value);	
Arguments	format, value	
format	A constant that specifies the number format.	
value	The number to be printed.	

Number formatting bits supplied by format

Pre-Defined format constants quick reference

DECIMAL			UNSIGNED DECIMAL			HEX			BINARY		
DEC	DECZ	DECZB	UDEC	UDECZ	UDECZB	HEX	HEXZ	HEXZB	BIN	BINZ	BINZB
DEC1	DEC1Z	DEC1ZB	UDEC1	UDEC1Z	UDEC1ZB	HEX1	HEX1Z	HEX1ZB	BIN1	BIN1Z	BIN1ZB
DEC2	DEC2Z	DEC2ZB	UDEC2	UDEC2Z	UDEC2ZB	HEX2	HEX2Z	HEX1ZB	BIN2	BIN2Z	BIN2ZB
DEC3	DEC3Z	DEC3ZB	UDEC3	UDEC3Z	UDEC3ZB	HEX3	HEX3Z	HEX1ZB	BIN3	BIN3Z	BIN3ZB
DEC4	DEC4Z	DEC4ZB	UDEC4	UDEC4Z	UDEC4ZB	HEX4	HEX4Z	HEX1ZB	BIN4	BIN4Z	BIN4ZB
DEC5	DEC5Z	DEC5ZB	UDEC5	UDEC5Z	UDEC5ZB				BIN5	BIN5Z	BIN5ZB
									BIN6	BIN6Z	BIN6ZB
									BIN7	BIN7Z	BIN7ZB
									BIN8	BIN8Z	BIN8ZB
									BIN9	BIN9Z	BIN9ZB
									BIN10	BIN10Z	BIN10ZB

									BIN11	BIN11Z	BIN11ZB
									BIN12	BIN12Z	BIN12ZB
									BIN13	BIN13Z	BIN13ZB
									BIN14	BIN14Z	BIN14ZB
									BIN15	BIN15Z	BIN15ZB
									BIN16	BIN16Z	BIN16ZB

Returns	field
	field Returns the the default width of the numeric field (digit count), usually ignored.
Description	This function prints a 16bit number in various formats to the current output stream, usually the display.
Example	<pre>var v; v := 05678; putnum(HEX, v); // print the number as hex 4 digits putnum(BIN, v); // print the number as binary 16 digits</pre>

2.20.6 print(...)

Syntax	<code>print(...);</code>
Arguments	See Description
Returns	nothing
Description	<p>4DGL has a versatile print(...) statement for formatting numbers and strings. In its simplest form, print will simply print a number inside a variable as shown below.</p> <pre>myvar := 100; print(myvar);</pre> <p>This will print 100 to the current output device (usually the display in TEXT mode, see to(...) function for more options).</p> <p>A string can be added anywhere within a print(...) statement by placing it inside a quoted string expression.</p> <pre>print("The value of myvar is : ", myvar, "and its 8bit binary representation is:-", [BIN8] myvar);</pre> <p>The print(...) statement can also accept directives passed in square brackets placed in front of the variable to be displayed within the print statement to make it print in various ways. The directives for numeric representation can be found in a table of putnum(..) function. Note that there are two print directives that are not part of the numeric set, these are the [STR] and [CHR] directives. The [STR] directive expects a standard (word) pointer to follow. The [CHR] directive prints the character value of a variable.</p> <p>In order to print a number in 4-digit hex, the [HEX4] directive is</p> <pre>print("myvar as a 4 digit HEX number is :- ", [HEX4] myvar); s := "Hello World"; // assign a string constant to s print("Var 's' points to a string constant at address", s, " which is", [STR] s); print("The third character of the string is '", [CHR] *(s+2)); print("The value of 'myvar' as an ASCII character is '", [CHR] myvar);</pre> <p>Note: This function can freely use a combination of string pointers, strings, variables and expressions within its statement. It can also be used with the to(...) function to redirect it's output to a different output device other than the screen using the function.</p>
Example	<pre>/////////////// // DATA STATEMENT // /////////////// #DATA word myData myString1, Bert, Fred, main, myString2, baud, barney, 0x1111,0x2222,0x3333,0x4444 byte myString1 "Data String OK\n\n",0 byte myString2 "\"(and forward referenced!)\"\n\n",0 word baud 150,300,600,1200,2400,9600 #END // this constant is a forward reference</pre>

```
#constant barney 9876

func Fred(var str)
    print("string = ", [STR] str);
endfunc

func Bert(var p1, var p2, var p3)
    print("hello from Bert\np1=",p1,"\\np2=",p2, "\\np3=",p3,"\\n");
    return "Bert was here\\n";
endfunc

func main()
    var fn;           // a variable for a handle for the function

    txt_Set(FONT_ID, FONT1);

    fn := myData[1]; //Get function pointer from data statement index
    print( [STR] fn(100,200,300) );
    // use it in a statement to prove engine ok

    fn := myData[2]; //Get function pointer from data statement index
    fn("ABC\\n");      // execute the function

    // just shows where main lives
    print("\naddress of main = code[, myData[3],]\\n\\n");
    // remember - a var can be a handle, variable, pointer or vector
    print( [STR] myData[0]);   // pointer table data reference
    print( [STR] myData[4]);

    repeat forever

endfunc
```

2.20.7 to(outstream)

Syntax	to(outstream);		
Arguments	outstream		
	outstream	A variable or constant specifying the destination for the putch() , putstr() , putnum() , print() and str_Printf functions.	
	Predefined Name	Constant	Redirection Destination
	APPEND	0x0000	Output is appended to user array if previous redirection was to an array.
	TEXT	0xF801	Output is directed to the screen (default).
	DSK	0xF802	Output is directed to the most recently open file that has been opened in write mode.
	COM0	0xFF04	Output is redirected to the COM0 (default serial) port.
	COM1	0xFF08	Output is redirected to the COM1 (auxilliary serial) port.
	I2C	0xF820	Output is directed to the I2C port.
	MDA	0xFF40	Output is directed to the SD/SDHC or FLASH media. Warning – be careful writing to a FAT16 formatted card without checking legal partitioned are else the disk formatting will be destroyed.
	(memory pointer)	Array address	Output is redirect to the memory pointer argument.
Returns	nothing		
Description	This function sends the printed output to destinations other than the screen. Normally, print just sends its output to the display in TEXT mode which is the default, however, the output from print can be sent to 'streams', eg – COM0 or COM1 , an open FAT16 file with DSK , to raw media with MDA (media), or to the I2C port with I2C . This function can also stream to a memory array. Note that once the function has taken effect, the stream reverts back to the default stream which is TEXT as soon as putch , putstr , putnum , print or str_Printf has completed its action. The APPEND argument is used to append the printed output to the same place as the previous redirection. This is most useful for building string arrays, or adding sequential data to a media stream.		
Example	<pre>//===== // Example #1 - putstr redirection //===== var buf[10]; // a buffer that will hold up to 20 bytes/chars var s; // a var for use as a pointer to(buf); putstr("ONE "); // redirect putstr to the buffer to(APPEND); putstr("TWO "); // and add a couple more items to(APPEND); putstr("THREE\n"); putstr(buf); // print the result while (media_Init() == 0); // wait if no SD/SDHC card detected media_SetSector(0, 2); // at sector 2 //media_SetAdd(0, 1024); // (alternatively, use media_SetAdd(), // // lower 9 bits ignored). to(MDA); putstr("Hello World"); // now write a ascii test string media_WriteByte('A'); // write a further 3 bytes media_WriteByte('B');</pre>		

```
media_WriteByte('C');
to(MDA); putstr(buf);           // write the buffer we prepared earlier
media_WriteByte(0);             // terminate with ASCII zero
media_Flush();
media_SetAdd(0, 1024);          // reset the media address
while(char:=media_ReadByte())
  to(COM0); putch(char); // print the stored string to the COM port
wend
repeat forever
```

2.20.8 charwidth('char')

Syntax	charwidth('char');	
Arguments	'char'	
	'char'	The ascii character for the width calculation.
Returns	width	
	width	Returns the width of a single character in pixel units.
Description	This function returns the width of a character in pixel units, based on the currently selected font. The font can be proportional or mono spaced. If the total width of the string exceeds 255 pixel units, the function will return the 'wrapped' (modulo 8) value.	
Example	<pre>//===== // Example //===== str := "HELLO\nTHERE"; // note that this string spans 2 lines due // to the \n. width := strwidth(str); // get the width of the string, this will // also capture the height. height := strheight(); // note, invoking strwidth also calcs height // which we can now read. // The string above spans 2 lines, strheight(.) will calculate height // correctly for multiple lines. len := strlen(str); // the strlen() function returns the number // of characters in a string. print("\nLength=",len); // NB:- the \n in "HELLO\nTHERE" is counted // as a character. txt_FontID(MS_SanSerif8x12); // select this font w := charwidth('W'); // get a characters width h := charheight('W'); // and height txt_FontID(0); // back to default font print ("\n'W' is " ,w, " pixels wide"); // show width of a character // 'W' in pixel units. print ("\n'W' is " ,h, " pixels high"); // show height of a character // 'W' in pixel units.</pre>	

2.20.9 charheight('char')

Syntax	<code>charheight('char');</code>	
Arguments	'char'	
	'char'	The ascii character for the height calculation.
Returns	width	
	width	Returns the height of a single character in pixel units.
Description	This function returns the height of a character in pixel units, based on the currently selected font. The font can be proportional or mono-spaced.	
Example	See example in charwidth()	

2.20.10 strwidth(pointer)

Syntax	<code>strwidth(pointer);</code>	
Arguments	pointer	
	pointer	The pointer to a zero (0x00) terminated string.
Returns	width	
	width	Returns the width of a string in pixel units.
Description	This function calculates the width of a zero terminated string in pixel units. Note that any string constants declared in your program are automatically terminated with a zero as an end marker by the compiler. Any string that you create in the DATA section or MEM section must have a zero added as a terminator for this function to work correctly.	
Example	See example in charwidth()	

2.20.11 strheight()

Syntax	strheight();	
Arguments	none	
Returns	height	
	height	Returns the height of a string in pixel units.
Description	This function returns the height of a zero terminated string in pixel units. The strwidth() function must be called first. Note that any string constants declared in your program are automatically terminated with a zero as an end marker by the compiler. Any string that you create in the DATA section or MEM section must have a zero added as a terminator for this function to work correctly.	
Example	See example in charwidth()	

2.20.12 strlen(pointer)

Syntax	strlen(pointer);	
Arguments	pointer	
	pointer	The pointer to a zero (0x00) terminated string.
Returns	length	
	length	Returns the length of a string in character units.
Description	This function returns the length of a zero terminated string in character units. Note that any string constants declared in your program are automatically terminated with a zero as an end marker by the compiler. Any string that you create in the DATA section or MEM section must have a zero added as a terminator for this function to work correctly.	
Example	See example in charwidth()	

2.20.13 txt_Set(function, value)

Syntax	<code>txt_Set(function, value);</code>	
Arguments	function, value	
function	The function number determines the required action for various text control functions. Usually a constant, but can be a variable, array element, or expression. There are pre-defined constants for each of the functions.	
	value	A variable, array element, expression or constant holding a value for the selected function.
Returns	nothing	
Description	Given a function number and a value, this function will set the required text control parameter, such as size, colour, and other formatting controls. This function is extremely useful in a loop to select multiple parameters from a data statement or a control array. Note also that each function available for txt_Set has a single parameter 'shortcut' function that has the same effect. (see the Single parameter shortcuts for the txt_Set functions on the next page)	
function		value
#	Predefined Name	Description
0	TEXT_COLOUR	Set the text foreground colour
1	TEXT_HIGHLIGHT	Set the text background colour
2	FONT_ID	Set the required font. 0 or FONT1 = system font 2 Or FONT3 = default fonts Note: The value could also be the name of a custom font included in a users program in a data statement, or the handle returned from file_LoadImageControl() for a uSD based font.
3	TEXT_WIDTH	Set the text width multiplier.
4	TEXT_HEIGHT	Set the text height multiplier.
5	TEXT_XGAP	Set the pixel gap between characters. The gap is in pixel units
6	TEXT_YGAP	Set the pixel gap between lines. The gap is in pixel units.
7	TEXT_PRINTDELAY	Set the delay between character printing
8	TEXT_OPACITY	Selects whether or not the 'background' pixels are drawn (default mode is OPAQUE)
9	TEXT_BOLD	Embolden text
10	TEXT_ITALIC	Italicise text
11	TEXT_INVERSE	Inverted text
12	TEXT_UNDERLINED	Underlined text
13	TEXT_ATTRIBUTES	Control of functions 9,10,11,12 grouped (bits can be combined by using logical 'or' of bits) nb:- bits 0-3 and 8-15 are reserved
14	TEXT_WRAP	Sets the pixel position where text wrap will occur at RHS The feature automatically resets when screen mode is changed. The value is in pixel units. Default value is 0.

Single parameter shortcuts for the `txt_Set(..)` functions

Function Syntax	Function Action	value
<code>txt_FGcolour()</code>	Set the text foreground colour	Colour 0-65535
<code>txt_BGcolour()</code>	Set the text background colour	Colour 0-65535
<code>txt_FontID(id)</code>	Set the required font. 0 or FONT1 = system font 2 Or FONT3 = default fonts Note: The value could also be the name of a custom font included in a users program in a data statement, or the handle returned from <code>file_LoadImageControl()</code> for a uSD based font.	0 to 2 or FONT1 FONT2 FONT3
<code>txt_Width(multiplier)</code>	Set the text width multiplier (note #6)	1 to 16 (Default =1)
<code>txt_Height(multiplier)</code>	Set the text height multiplier (note #6)	1 to 16 (Default =1)
<code>txt_Xgap(pixelcount)</code>	Set the pixel gap between characters. The gap is in pixel units	0 to 32(Default =0)
<code>txt_Ygap(pixelcount)</code>	Set the pixel gap between lines. The gap is in pixel units.	0 to 32(Default =0)
<code>txt_Delay(milliseconds)</code>	Set the delay between character printing.	(not used)
<code>txt_Opacity(mode)</code>	Selects whether or not the 'background' pixels are drawn (default mode is OPAQUE)	0 or TRANSPARENT 1 or OPAQUE
<code>txt_Bold(mode)</code>	Embolden text	0 or 1 (ON or OFF)
<code>txt_Italic(mode)</code>	Italic text	0 or 1 (ON or OFF)
<code>txt_Inverse(mode)</code>	Inverted text	0 or 1 (ON or OFF)
<code>txt_Underlined(mode)</code>	Underlined text	0 or 1 (ON or OFF)
<code>txt_Attributes(value)</code>	Control of functions 9, 10, 11, 12 grouped (bits can be combined by using logical 'OR' of bits) nb:- bits 0-3 and 8-15 are reserved	16 or BOLD 32 or ITALIC 64 or INVERSE 128 or UNDERLINED
<code>txt_Wrap(value)</code>	Sets the pixel position where text wrap will occur at RHS The feature automatically resets when screen mode is changed. The value is in pixel units. Default value is 0.	0 to n(OFF or Value)

2.21. Timer Functions

Summary of functions in this section:

- sys_T()
- sys_T_HI()
- sys_SetTimer(timernum, value)
- sys_GetTimer(timernum)
- sys_SetTimerEvent(timernum, function)
- sys_EventQueue()
- sys_EventsPostpone()
- sys_EventsResume()
- sys_DeepSleep(units)
- sys_Sleep(units)
- iterator(offset)

2.21.1 sys_T()

Syntax	sys_T();	
Arguments	none	
Returns	value	
	value	Returns the value of system timer. (LO Word)
Description	Returns the current value of the rolling 32-bit system timer (1ms) LO word.	
Example	t := sys_T();	

2.21.2 sys_T_HI()

Syntax	sys_T_HI();	
Arguments	none	
Returns	value	
	value	Returns the value of system timer. (HI Word)
Description	Returns the current value of the rolling 32bit system timer (1ms) HI word.	
Example	t := sys_T_HI();	

2.21.3 sys_SetTimer(timerNum, value)

Syntax	sys_SetTimer(timerNum, value);	
Arguments	timerNum, value	
	timerNum	One of eight timers TIMER0 to TIMER7 .
	value	Countdown period in milliseconds.
	The “value” can be a variable, array element, expression or constant	
Returns	nothing	
Description	<p>Set a countdown on the selected timer or 'top-up' if required. There are eight timers TIMER0 to TIMER7 which stop at the count of 0. Maximum timeout period is 65535 milliseconds or 65.535 seconds.</p> <p>A timer can be read with the sys_GetTimer() function.</p>	
Example	sys_SetTimer(TIMER5, 3600); // Set Timer5 for 3.6 seconds	

2.21.4 sys_GetTimer(timernum)

Syntax	<code>sys_GetTimer(timernum);</code>	
Arguments	timernum	
	timernum	One of eight timers TIMER0 to TIMER7.
Returns	value	
	value	Returns 0 if timer has expired, or the current countdown value.
Description	Returns 0 if timer has expired, or the current countdown value. There are 8 timers TIMER0 to TIMER7 which stop at the count of 0. Maximum timeout period is 65, 535 milliseconds or 65.535 seconds. A timer can be set with the <code>sys_SetTimer("timernum", "value")</code> function.	
Example	<code>t := sys_GetTimer(TIMER2);</code>	

2.21.5 sys_SetTimerEvent(timerNum, function)

Syntax	<code>sys_SetTimerEvent(timerNum, function);</code>	
Arguments	timerNum, function	
	timerNum	One of eight timers TIMER0 to TIMER7.
	function	Event Function to be queued
Returns	address	
	address	Returns any previous event function address, or zero if there was no previous function.
Description	<p>Set a function to be called for selected timer. When the timer reaches zero, the function is called. The called function must not have any parameters, and should not have a return value. This is necessary because the timer event is invoked asynchronously to the mainline program (i.e. it is not called in the normal way, so parameters and return values don't apply).</p> <p>Note: When a child process is run using the <code>file_run</code> or <code>file_exec</code> function, or if a file was loaded with <code>file_Loadfunction()</code> and is executed, the loaded process gets its own code and memory space, therefore, any timer that reaches zero that has a timer event attached in the parent code space, will fail and cause a crash as an attempt is made to force the program counter to some wild place in the child process - There are 2 ways to overcome this problem.</p> <p>1] If a child process will not be requiring the use of any timers or timer events, the parent program can simply use the <code>sys_EventsPostpone()</code> function before calling or entering the child process. Once the parent program regains control, the <code>sys_EventResume()</code> function will allow any events in the queue to then be processed. The side effect of this method is that several events may bank up, and will execute immediately once the <code>sys_EventResume()</code> takes place. This however disallows a child process to use any timer events in the sub program so method 2 is preferable in this case.</p> <p>2] The parent program can 'disconnect' the event(s) by setting it/them to zero prior to child process execution, or setting the associated timer to zero so the event won't fire. In either case, it is necessary to do the following:-</p> <pre>while(sys_EventQueue());</pre> <p>To ensure the event queue is empty prior to calling the child process. Note also that if just the timer is set to zero, the child process cannot use this timer. If the timer was now set to a value and the old event still existed, when the timer reaches zero the 'bad' parent address event will fire causing a crash.</p> <p>The reverse situation also applies of course, the same level of respect is required if a child program needs to use any timer events. Method [1] (above) will not work as the events have been postponed, stopping the child process from using any timer events. If the child process did an <code>sys_EventResume()</code> in this case, everything would crash miserably. So the same applies, a child that uses any timer events must respect any timers that may be used by the parent, and a child must zero the <code>sys_SetTimerEvent</code> before returning to the parent.</p> <p><code>sys_SetTimerEvent(timerNum, 0)</code> disables the timer event.</p>	
Example	<code>sys_SetTimerEvent(TIMER5, myfunc);</code>	

2.21.6 sys_EventQueue()

Syntax	<code>sys_EventQueue();</code>	
Arguments	<code>none</code>	
Returns	<code>count</code>	
	<code>count</code>	Returns number of events.
Description	Returns the max number of events that were pending in the queue since the last call to this function. This can be used to assess event overhead burden, especially after or during a <code>sys_EventsPostpone()</code> action.	
Example	<code>tasks := sys_EventQueue();</code>	

2.21.7 sys_EventsPostpone()

Syntax	<code>sys_EventsPostpone();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	<p>Postpone any events until the <code>sys_EventResume()</code> function is executed. The event queue will continue to queue events, but no action will take place until a <code>sys_EventResume()</code> function is encountered.</p> <p>The queue will continue to receive up to 32 events before discarding any further events. This function is required to allow a sequence of instructions or functions to occur that would otherwise be corrupted by an event occurring during the sequence of instructions or functions.</p> <p>A good example of this is when you set a position to print, if there was no way of locking the current sequence, an event may occur which does a similar thing, and a contention would occur - printing to the wrong position. This function should be used wisely, if any action that is required would take considerable time, it is better to disable any conflicting event functions with a bypass flag, then restart the conflicting event by re-issuing a timer value.</p>
Example	<code>sys_EventsPostpone(); // postpone the event queue</code>

2.21.8 sys_EventsResume()

Syntax	<code>sys_EventsResume();</code>
Arguments	<code>none</code>
Returns	<code>nothing</code>
Description	Resume any postponed events. The queue will try to execute any events that were incurred during the postponed period. Note that queued events are only checked for and executed at the end of each 4DGL instruction.
Example	<code>sys_EventsResume(); // resume the event queue</code>

2.21.9 sys_DeepSleep(units)

Syntax	<code>sys_DeepSleep(units);</code>	
Arguments	units	
	units	Sleep timer units are approx 1 second. When in sleep mode, timing is controlled by an RC oscillator, therefore, timing is not totally accurate and should not be relied on for timing purposes
	The arguments can be a variable, array element, expression or constant	
Returns	status	
	status	Remaining time units when touch screen is touched, else returns zero.
Description	Put the display and processor into lowest power mode for a period of time. If "units" is zero, the display goes into sleep mode forever and needs power cycling to re-initialize. If "units" is 1 to 65535, the display will sleep for that period of time, or will be woken when the touch screen is touched. The function returns the count of "units" that are remaining when the screen was touched. When returning from deep sleep mode, the processor is restored from low power mode, the display should be reinitialised with disp_Init() .	
Example	<code>sys_DeepSleep(60); // Sleep for 1 minute.</code>	

2.21.10 sys_Sleep(units)

Syntax	<code>sys_Sleep(units);</code>	
Arguments	units	
	units	Sleep timer units are approx 1 second. When in sleep mode, timing is controlled by an RC oscillator, therefore, timing is not totally accurate and should not be relied on for timing purposes
	The arguments can be a variable, array element, expression or constant	
Returns	Status	
	Status	Remaining time units when touch screen is touched, else returns zero.
Description	Put the display and processor into low power mode for a period of time. If "units" is zero, the display goes into sleep mode forever and needs power cycling to re-initialize. If "units" is 1 to 65535, the display will sleep for that period of time, or will be woken when the touch screen is touched. The function returns the count of "units" that are remaining when the screen was touched. When returning from sleep mode, the display and processor are restored from low power mode.	
Example	<code>sys_Sleep(60); // Sleep for 1 minute.</code>	

2.21.11 iterator(offset)

Syntax	iterator(offset);
Arguments	offset
	offset Offset size for the next ++ or -- command The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Sets the iterator size for the next postinc, postdec, preinc or predec by a specified value. The offset will return to 1 after the next operation.
Example	t := iterator(10);

2.22. Touch Screen Functions

Summary of functions in this section:

- touch_DetectRegion(x1, y1, x2, y2)
- touch_Set(mode)
- touch_Get(mode)

2.22.1 touch_DetectRegion(x1, y1, x2, y2)

Syntax	touch_DetectRegion(x1, y1, x2, y2);
Arguments	x1, y1, x2, y2
	x1 Specifies the horizontal position of the top left corner of the region.
	y1 Specifies the vertical position of the top left corner of the region.
	x2 Specifies the horizontal position of the bottom right corner of the region.
	y2 Specifies the vertical position of the bottom right corner of the region.
Returns	nothing
Description	Specifies a new touch detect region on the screen. This setting will filter out any touch activity outside the region and only touch activity within that region will be reported by the status poll touch_Get() function.
Example	<pre>gfx.Rectangle(100, 100, 201, 201, YELLOW); // draw a rectangle with // a yellow border touch_DetectRegion(101, 101, 200, 200); // limit touch detect region to // within the rectangle</pre>

2.22.2 touch_Set(mode)

Syntax	<code>touch_Set(mode);</code>	
Arguments	mode	
	mode	mode = 0 (TOUCH_ENABLE): Enables and initialises Touch Screen hardware mode = 1 (TOUCH_DISABLE): Disables the Touch Screen mode = 2 (TOUCH_REGIONDEFAULT): This will reset the current active region to default which is the full screen area Note: Touch Screen task runs in the background and disabling it when not in use will free up extra resources for 4DGL CPU cycles.
Returns	nothing	
Description	Sets various Sets various Touch Screen related parameters.	
Example	<code>touch_Set(TOUCH_DISABLE); // Disable touch touch_Set(TOUCH_ENABLE); // Enable touch touch_Set(TOUCH_ENABLE); // Reset default touch region</code>	

2.22.3 touch_Get(mode)

Syntax	touch_Get(mode);	
Arguments	mode	
	mode	mode = 0 (TOUCH_STATUS): Get touch status mode = 1 (TOUCH_GETX): Get X-coordinates mode = 2 (TOUCH_GETY): Get Y-coordinates
Returns	value	
	value	mode = 0 (TOUCH_STATUS) Returns the various states of the touch screen 0 = INVALID/NOTOUCH 1 = PRESS 2 = RELEASE 3 = MOVING mode = 1 (TOUCH_GETX) Returns the X coordinates of the touch reported by mode 0 mode = 2 (TOUCH_GETY) Returns the Y coordinates of the touch reported by mode 0
Description	Returns various Touch Screen parameters to caller.	
Example	<pre> state := touch_Get(TOUCH_STATUS); // get touchscreen status x := touch_Get(TOUCH_GETX); y := touch_Get(TOUCH_GETY); if (state == TOUCH_PRESSED) // see if Exit hit if (x > 170 && y > 280) // EXIT button gfx_Cls(); exit := -1; endif if (vertical) if (x > 170 && (y > 240 && y < 270))// Horiz button vertical := 0; exit := 1; endif else if (x > 170 && (y > 200 && y < 230))// Vert button vertical := 1; exit := 2; endif endif endif </pre>	

2.23. Widget Functions

Summary of functions in this section:

- `widget_Create(count)`
- `widget_Add(hndl, index, widget)`
- `widget_Delete(hndl, index)`
- `widget_Realloc(handle, n)`
- `widget_LoadFlash(Extra)`
- `widget_Show(hndl, index)`
- `widget_SetWord(hndl, index, offset, value)`
- `widget_GetWord(hndl, index, offset)`
- `widget_Setposition(hndl, index, xpos, ypos)`
- `widget_Enable(hndl, index)`
- `widget_Disable(hndl, index)`
- `widget_SetAttributes(hndl, index, value)`
- `widget_ClearAttributes(hndl, index, value)`
- `widget_Touched(hndl, index)`
- `widget_FontID(id)`

2.23.1 widget_Create(count)

Syntax	widget_Create(count)	
Arguments	count	
	count	The number of elements in the widget control
		The argument can be a variable, array element, expression or constant.
Returns	hdl	
	hdl	Returns a handle (pointer to the memory allocation) to the widget control that has been created.
Description	Creates a widget control capable of holding count elements and returns a handle for the control.	
Example	<pre>var hndl; hndl := widget_Create(1);</pre>	

2.23.2 widget_Add(hndl, index, widget)

Syntax	widget_Add(hndl, index, widget)
Arguments	hndl, index, widget
	hndl Handle of the widget control
	index Index of element in the widget control
	widget Pointer to RAM allocation of the entry widget
	The arguments can be a variable, array element, expression or constant
Returns	nothing
Description	Add a widget ram entry " widget " into index " index " of the widget control referenced by " hndl ".
Example	<pre>var hndl; hndl := widget_Create(1); widget_Add(hndl, 0, IIled1RAM); // Add entry index 0 for Led</pre>

2.23.3 widget_Delete(hndl, index)

Syntax	widget_Delete(hndl, index)
Arguments	hndl, index
	hndl Handle of the widget control
	index Index of element in the widget control
	The arguments can be a variable, array element, expression or constant.
Returns	nothing
Description	Delete widget ram entry " index " from the widget control referenced by " hndl ".
Example	<pre>var hndl; hndl := widget_Create(1); widget_Add(hndl, 0, ILed1RAM); // Add entry index 0 for Led1 widget_Delete(hndl, 0); // Remove entry index 0</pre>

2.23.4 widget_Realloc(handle, n)

Syntax	widget_Realloc(handle, n)	
Arguments	handle, n	
	handle	Handle of the widget control
	n	New number of entries
	The arguments can be a variable, array element, expression or constant.	
Returns	hdl	
	hdl	Returns new handle to widget control
Description	Resizes a widget control " handle " to contain n entries, allowing it to be expanded or condensed. Doing this unnecessarily can lead to RAM fragmentation. It is much better to allocate widget controls once with the desired number of entries.	
Example	<pre>var hndl; hndl := widget_Create(10); widget_Add(hndl, 0, IILed1RAM); widget_Add(hndl, 1, IILed2RAM); widget_Add(hndl, 2, IILed3RAM); hndl := widget_Realloc(hndl, 3); // Reallocate widget control</pre>	

2.23.5 widget_LoadFlash(Extra)

Syntax	widget_LoadFlash(Extra)	
Arguments	Extra	
	Extra	The number of extra widget controls to be created beyond the count in flash memory
		The arguments can be a variable, array element, expression or constant.
Returns	status	
	status	Returns a handle (pointer to the memory allocation) to the widget control list that has been created. Returns NULL if function fails.
Description	Reads the flash control file to create a widget list.	
Example	<pre>var hImagelist; hImagelist := widget_LoadFlash(0);</pre>	

2.23.6 widget_Show(hndl, index)

Syntax	widget_Show(hndl, index)
Arguments	hndl, index
	hndl Handle of the widget control
	index Index of element in the widget control
	The arguments can be a variable, array element, expression or constant.
Returns	TRUE if successful, return value usually ignored.
Description	Display a flash resident image entry.
Example	<pre>var hndl; hndl := widget_LoadFlash(0); widget_Show(hndl, 0);</pre>

2.23.7 widget_SetWord(hndl, index, offset, value)

Syntax	<code>widget_SetWord(hndl, index, offset, value)</code>																																										
Arguments	hndl , index , offset , value hndl Handle of the widget control index Index of element in the widget control offset Offset of the required word in the widget entry value The word to be written to the entry The arguments can be a variable, array element, expression or constant.																																										
Returns	status status Returns TRUE if successful, return value usually ignored																																										
Description	Set specified word in an image entry. This function requires that a widget control has been created with the <code>widget_Create()</code> function. <table> <tbody> <tr><td>WIDGET_XPOS</td><td>0</td><td>RAM xpos</td></tr> <tr><td>WIDGET_YPOS</td><td>1</td><td>RAM ypos</td></tr> <tr><td>WIDGET_WIDTH</td><td>2</td><td>RAM width, needed for touch</td></tr> <tr><td>WIDGET_HEIGHT</td><td>3</td><td>RAM height, needed for touch</td></tr> <tr><td>WIDGET_XOTHER</td><td>4</td><td>RAM xpos 'other' (Non Flash widgets only)</td></tr> <tr><td>WIDGET_LO_WORD</td><td>4</td><td>Flash offset low word (Flash widgets only)</td></tr> <tr><td>WIDGET_YOTHER</td><td>5</td><td>RAM ypos 'other' (Non Flash widgets only)</td></tr> <tr><td>WIDGET_HI_WORD</td><td>5</td><td>Flash offset high word (Flash widgets only)</td></tr> <tr><td>WIDGET_FLAGS</td><td>6</td><td>RAM flags</td></tr> <tr><td>WIDGET_TAG</td><td>7</td><td>RAM tag (user or FORM#)</td></tr> <tr><td>WIDGET_TAG2</td><td>8</td><td>RAM tag2 (user or object << 8 object_id)</td></tr> <tr><td>WIDGET_VAL1</td><td>9</td><td>RAM current value</td></tr> <tr><td>WIDGET_DELAY</td><td>10</td><td>Inter frame delay (Flash widgets only)</td></tr> <tr><td>WIDGET_FRAMES</td><td>11</td><td>Number of frames (Flash widgets only)</td></tr> </tbody> </table>	WIDGET_XPOS	0	RAM xpos	WIDGET_YPOS	1	RAM ypos	WIDGET_WIDTH	2	RAM width, needed for touch	WIDGET_HEIGHT	3	RAM height, needed for touch	WIDGET_XOTHER	4	RAM xpos 'other' (Non Flash widgets only)	WIDGET_LO_WORD	4	Flash offset low word (Flash widgets only)	WIDGET_YOTHER	5	RAM ypos 'other' (Non Flash widgets only)	WIDGET_HI_WORD	5	Flash offset high word (Flash widgets only)	WIDGET_FLAGS	6	RAM flags	WIDGET_TAG	7	RAM tag (user or FORM#)	WIDGET_TAG2	8	RAM tag2 (user or object << 8 object_id)	WIDGET_VAL1	9	RAM current value	WIDGET_DELAY	10	Inter frame delay (Flash widgets only)	WIDGET_FRAMES	11	Number of frames (Flash widgets only)
WIDGET_XPOS	0	RAM xpos																																									
WIDGET_YPOS	1	RAM ypos																																									
WIDGET_WIDTH	2	RAM width, needed for touch																																									
WIDGET_HEIGHT	3	RAM height, needed for touch																																									
WIDGET_XOTHER	4	RAM xpos 'other' (Non Flash widgets only)																																									
WIDGET_LO_WORD	4	Flash offset low word (Flash widgets only)																																									
WIDGET_YOTHER	5	RAM ypos 'other' (Non Flash widgets only)																																									
WIDGET_HI_WORD	5	Flash offset high word (Flash widgets only)																																									
WIDGET_FLAGS	6	RAM flags																																									
WIDGET_TAG	7	RAM tag (user or FORM#)																																									
WIDGET_TAG2	8	RAM tag2 (user or object << 8 object_id)																																									
WIDGET_VAL1	9	RAM current value																																									
WIDGET_DELAY	10	Inter frame delay (Flash widgets only)																																									
WIDGET_FRAMES	11	Number of frames (Flash widgets only)																																									
Example	<pre>#DATA word IGauge1 10, 10, 30, 160, 80, 0, 100, 0, 0, 0x18E3, 0x0280, LIME, 0x5280, YELLOW, 0x5000, RED, 51, 36, 0x0 #END var IGauge1RAM [WIDGET_RAM_SPACE]; func main() var hndl; hndl := widget_Create(1); widget_Add(hndl, 0, IGauge1RAM); gfx_Gauge(50, IGauge1RAM, IGauge1); widget_SetWord(hndl, 0, WIDGET_XPOS, 45); gfx_Gauge(50, IGauge1RAM, IGauge1); repeat forever endfunc</pre>																																										

2.23.8 widget_GetWord(hndl, index, offset)

Syntax	widget_GetWord(hndl, index, offset)																																											
Arguments	hndl, index, offset																																											
	hndl	Handle of the widget control																																										
	index	Index of element in the widget control																																										
	offset	Offset of the required word in the widget entry																																										
	The arguments can be a variable, array element, expression or constant.																																											
Returns	value																																											
	value	Returns the specified word (0-14) from a widget entry.																																										
Description	Returns specified word (0-14) from a widget entry. Refer to widget control entry offsets. This function requires that a widget control has been created with the widget_Create() function. <table> <tbody> <tr><td>WIDGET_XPOS</td><td>0</td><td>RAM xpos</td></tr> <tr><td>WIDGET_YPOS</td><td>1</td><td>RAM ypos</td></tr> <tr><td>WIDGET_WIDTH</td><td>2</td><td>RAM width, needed for touch</td></tr> <tr><td>WIDGET_HEIGHT</td><td>3</td><td>RAM height, needed for touch</td></tr> <tr><td>WIDGET_XOTHER</td><td>4</td><td>RAM xpos 'other' (Non Flash widgets only)</td></tr> <tr><td>WIDGET_LO_WORD</td><td>4</td><td>Flash offset low word (External Flash widgets only)</td></tr> <tr><td>WIDGET_YOTHER</td><td>5</td><td>RAM ypos 'other' (Non Flash widgets only)</td></tr> <tr><td>WIDGET_HI_WORD</td><td>5</td><td>Flash offset high word (Flash widgets only)</td></tr> <tr><td>WIDGET_FLAGS</td><td>6</td><td>RAM flags</td></tr> <tr><td>WIDGET_TAG</td><td>7</td><td>RAM tag (user or FORM#)</td></tr> <tr><td>WIDGET_TAG2</td><td>8</td><td>RAM tag2 (user or object << 8 object_id)</td></tr> <tr><td>WIDGET_VAL1</td><td>9</td><td>RAM current value</td></tr> <tr><td>WIDGET_DELAY</td><td>10</td><td>Inter frame delay (Flash widgets only)</td></tr> <tr><td>WIDGET_FRAMES</td><td>11</td><td>Number of frames (Flash widgets only)</td></tr> </tbody> </table>		WIDGET_XPOS	0	RAM xpos	WIDGET_YPOS	1	RAM ypos	WIDGET_WIDTH	2	RAM width, needed for touch	WIDGET_HEIGHT	3	RAM height, needed for touch	WIDGET_XOTHER	4	RAM xpos 'other' (Non Flash widgets only)	WIDGET_LO_WORD	4	Flash offset low word (External Flash widgets only)	WIDGET_YOTHER	5	RAM ypos 'other' (Non Flash widgets only)	WIDGET_HI_WORD	5	Flash offset high word (Flash widgets only)	WIDGET_FLAGS	6	RAM flags	WIDGET_TAG	7	RAM tag (user or FORM#)	WIDGET_TAG2	8	RAM tag2 (user or object << 8 object_id)	WIDGET_VAL1	9	RAM current value	WIDGET_DELAY	10	Inter frame delay (Flash widgets only)	WIDGET_FRAMES	11	Number of frames (Flash widgets only)
WIDGET_XPOS	0	RAM xpos																																										
WIDGET_YPOS	1	RAM ypos																																										
WIDGET_WIDTH	2	RAM width, needed for touch																																										
WIDGET_HEIGHT	3	RAM height, needed for touch																																										
WIDGET_XOTHER	4	RAM xpos 'other' (Non Flash widgets only)																																										
WIDGET_LO_WORD	4	Flash offset low word (External Flash widgets only)																																										
WIDGET_YOTHER	5	RAM ypos 'other' (Non Flash widgets only)																																										
WIDGET_HI_WORD	5	Flash offset high word (Flash widgets only)																																										
WIDGET_FLAGS	6	RAM flags																																										
WIDGET_TAG	7	RAM tag (user or FORM#)																																										
WIDGET_TAG2	8	RAM tag2 (user or object << 8 object_id)																																										
WIDGET_VAL1	9	RAM current value																																										
WIDGET_DELAY	10	Inter frame delay (Flash widgets only)																																										
WIDGET_FRAMES	11	Number of frames (Flash widgets only)																																										
Example	<pre>#DATA word Led1Info 5, 30, 103, 56, 0x2965, BLACK, 0xDEFB, 0xF800, 0x5800, 20, 30, 10, 20, 1 #END var Led1Ram[WIDGET_RAM_SPACE]; func main() var hndl; var width; hndl := widget_Create(1); widget_Add(hndl, 0, Led1Ram); gfx_Led(0, Led1Ram, Led1Info); width := widget_GetWord(hndl, 0, WIDGET_WIDTH); print(width); // Print widget width from RAM repeat forever endfunc</pre>																																											

2.23.9 widget_Setposition(hndl, index, xpos, ypos)

Syntax	widget_Setposition(hndl, index, xpos, ypos)	
Arguments	hndl, index, xpos, ypos	
	hndl	Handle of the widget control
	index	Index of element in the widget control
	xpos	x-coordinate of position
	ypos	y-coordinate of position
	The arguments can be a variable, array element, expression or constant.	
Returns	status	
	status	Returns true if index was ok and function was successful.
Description	Set the position of an entry in the widget control. This function requires that a widget control has been created with the widget_Create() function.	
Example	<pre>#DATA word Led1Info 5, 5, 103, 56, 0x2965, BLACK, 0xDEFB, 0xF800, 0x5800, 20, 30, 10, 20, 1 #END var Led1Ram[WIDGET_RAM_SPACE]; func main() var hndl; hndl := widget_Create(1); widget_Add(hndl, 0, Led1Ram); gfx_Led(0, Led1Ram, Led1Info); pause(2000); gfx_Cls(); widget_Setposition(hndl, 0, 50, 50); // Set new widget position gfx_Led(0, Led1Ram, Led1Info); repeat forever endfunc</pre>	

2.23.10 widget_Enable(hndl, index)

Syntax	widget_Enable(hndl, index)
Arguments	hndl Handle of the widget control index Index of element in the widget control The arguments can be a variable, array element, expression or constant.
Returns	status status Returns true if index was ok and function was successful.
Description	Enable an item in a widget control. This function requires that a widget control has been created with the widget_Create() function.
Example	<pre>#DATA word IILed1 5, 30, 103, 56, 0x2965, BLACK, 0xDEFB, 0xF800, 0x5800, 20, 30, 10, 20, 1 word IILed2 5, 90, 103, 56, 0x2965, BLACK, 0xDEFB, BLUE, 0x000B, 20, 30, 10, 20, 1 #END var ILed1RAM[WIDGET_RAM_SPACE] ; var ILed2RAM[WIDGET_RAM_SPACE] ; func main() var hndl, i; hndl := widget_Create(2); widget_Add(hndl, 0, ILed1RAM); widget_Add(hndl, 1, ILed2RAM); repeat if (i == 0) widget_Disable(hndl, 0); // Disable LED 0 widget_Enable(hndl, 1); // Enable LED 1 else widget_Disable(hndl, 1); // Disable LED 1 widget_Enable(hndl, 0); // Enable LED 0 endif // Draw LED widgets widget_ClearAttributes(hndl, ALL, WIDGET_F_INITIALISED); gfx_Led(0, ILed1RAM, IILed1); gfx_Led(0, ILed2RAM, IILed2); pause(2000); gfx_Cls(); i := !(i); forever endfunc</pre>

2.23.11 `widget_Disable(hndl, index)`

Syntax	<code>widget_Disable(hndl, index)</code>	
Arguments	hndl, index	
	hndl	Handle of the widget control
	index	Index of element in the widget control
	The arguments can be a variable, array element, expression or constant.	
Returns	status	
	status	Returns true if index was ok and function was successful.
Description	Disable an item in a widget control. This function requires that a widget control has been created with the <code>widget_Create()</code> function.	
Example	See example in section <code>widget_Enable(...)</code> .	

2.23.12 widget_SetAttributes(hndl, index, value)

Syntax	widget_SetAttributes(hndl, index, value)																						
Arguments	hndl, index, value																						
	hndl	Handle of the widget control																					
	index	Index of element in the widget control																					
	value	The word to be written to the entry																					
	The arguments can be a variable, array element, expression or constant.																						
Returns	status																						
	status	Returns TRUE if successful, return value usually ignored.																					
Description	<p>This function SETS one or more bits in the widget flags field of a widget control entry. "value" refers to various bits in the widget control entry (see widget attribute flags). A '1' bit in the "value" field SETS the respective bit in the widget flags field of the widget control entry.</p> <p>Widget attribute flags to be used and maintained by widgets and touch processing:</p> <table> <tbody> <tr> <td>WIDGET_F_TOUCH_ENABLE</td> <td>0x8000</td> <td>Set to disable touch for this image, (default=1 for movie, 0 for image)</td> </tr> <tr> <td>WIDGET_F_INTERNAL</td> <td>0x4000</td> <td>Internal use only (force redraw on next write)</td> </tr> <tr> <td>WIDGET_F_INITIALISED</td> <td>0x2000</td> <td>Flag when 'base gauge needle, etc.' is done</td> </tr> <tr> <td>WIDGET_F_UNDRAW_ONLY</td> <td>0x1000</td> <td>Set to prevent draw of new needle</td> </tr> <tr> <td>WIDGET_F_INPUT</td> <td>0x0800</td> <td>Set if this is an input (Used only with the IDE)</td> </tr> <tr> <td>WIDGET_F_FLASH</td> <td>0x0400</td> <td>set if this is a flash based widget</td> </tr> <tr> <td>WIDGET_F_RESERVED</td> <td>0x03c0</td> <td>bits 9-6 reserved</td> </tr> </tbody> </table>		WIDGET_F_TOUCH_ENABLE	0x8000	Set to disable touch for this image, (default=1 for movie, 0 for image)	WIDGET_F_INTERNAL	0x4000	Internal use only (force redraw on next write)	WIDGET_F_INITIALISED	0x2000	Flag when 'base gauge needle, etc.' is done	WIDGET_F_UNDRAW_ONLY	0x1000	Set to prevent draw of new needle	WIDGET_F_INPUT	0x0800	Set if this is an input (Used only with the IDE)	WIDGET_F_FLASH	0x0400	set if this is a flash based widget	WIDGET_F_RESERVED	0x03c0	bits 9-6 reserved
WIDGET_F_TOUCH_ENABLE	0x8000	Set to disable touch for this image, (default=1 for movie, 0 for image)																					
WIDGET_F_INTERNAL	0x4000	Internal use only (force redraw on next write)																					
WIDGET_F_INITIALISED	0x2000	Flag when 'base gauge needle, etc.' is done																					
WIDGET_F_UNDRAW_ONLY	0x1000	Set to prevent draw of new needle																					
WIDGET_F_INPUT	0x0800	Set if this is an input (Used only with the IDE)																					
WIDGET_F_FLASH	0x0400	set if this is a flash based widget																					
WIDGET_F_RESERVED	0x03c0	bits 9-6 reserved																					
Example	<pre>#DATA word Slider1Info 10, 10, 250, 40, 0, 0, 100, 0x1082, 0x0, 0x7E0, 30, 30, 2, 2, 10, 0x7E0, 5, 0x7E0, FONT3, 0xFFE0, 0x1082, 0x9CD3, GRAD_DOWN, 0x1082, 0x9CD3, GRAD_UP #END var Slider1Ram[10]; func main() var hndl; hndl := widget_Create(1); widget_Add(hndl, 0, Slider1Ram); widget_SetAttributes(hndl, 0, WIDGET_F_TOUCH_ENABLE); gfx_Slider5(frame, Slider1Ram, Slider1Info); repeat // do something here forever endfunc</pre>																						

2.23.13 widget_ClearAttributes(hndl, index, value)

Syntax	widget_ClearAttributes(hndl, index, value)																						
Arguments	hndl, index, value																						
	hndl	Handle of the widget control																					
	index	Index of element in the widget control																					
	value	The word to be written to the entry																					
	The arguments can be a variable, array element, expression or constant.																						
Returns	status																						
	status	Returns TRUE if successful, return value usually ignored.																					
Description	<p>This function CLEARS one or more bits in the widget flags field of an image control entry. "value" refers to various bits in the widget control entry (see widget attribute flags). A '1' bit in the "value" field CLEARS the respective bit in the widget flags field of the image control entry.</p> <p>Widget attributes flags to be used and maintained by widgets and touch processing:</p> <table> <tbody> <tr> <td>WIDGET_F_TOUCH_ENABLE</td> <td>0x8000</td> <td>Set to disable touch for this image, (default=1 for movie, 0 for image)</td> </tr> <tr> <td>WIDGET_F_INTERNAL</td> <td>0x4000</td> <td>Internal use only (force redraw on next write)</td> </tr> <tr> <td>WIDGET_F_INITIALISED</td> <td>0x2000</td> <td>Flag when 'base gauge needle, etc.' is done</td> </tr> <tr> <td>WIDGET_F_UNDRAW_ONLY</td> <td>0x1000</td> <td>Set to prevent draw of new needle</td> </tr> <tr> <td>WIDGET_F_INPUT</td> <td>0x0800</td> <td>Set if this is an input (Used only with the IDE)</td> </tr> <tr> <td>WIDGET_F_FLASH</td> <td>0x0400</td> <td>set if this is a flash based widget</td> </tr> <tr> <td>WIDGET_F_RESERVED</td> <td>0x03c0</td> <td>bits 9-6 reserved</td> </tr> </tbody> </table>		WIDGET_F_TOUCH_ENABLE	0x8000	Set to disable touch for this image, (default=1 for movie, 0 for image)	WIDGET_F_INTERNAL	0x4000	Internal use only (force redraw on next write)	WIDGET_F_INITIALISED	0x2000	Flag when 'base gauge needle, etc.' is done	WIDGET_F_UNDRAW_ONLY	0x1000	Set to prevent draw of new needle	WIDGET_F_INPUT	0x0800	Set if this is an input (Used only with the IDE)	WIDGET_F_FLASH	0x0400	set if this is a flash based widget	WIDGET_F_RESERVED	0x03c0	bits 9-6 reserved
WIDGET_F_TOUCH_ENABLE	0x8000	Set to disable touch for this image, (default=1 for movie, 0 for image)																					
WIDGET_F_INTERNAL	0x4000	Internal use only (force redraw on next write)																					
WIDGET_F_INITIALISED	0x2000	Flag when 'base gauge needle, etc.' is done																					
WIDGET_F_UNDRAW_ONLY	0x1000	Set to prevent draw of new needle																					
WIDGET_F_INPUT	0x0800	Set if this is an input (Used only with the IDE)																					
WIDGET_F_FLASH	0x0400	set if this is a flash based widget																					
WIDGET_F_RESERVED	0x03c0	bits 9-6 reserved																					
Example	<pre>#DATA word fLed1Info 5, 5, 103, 56, 0x2965, BLACK, 0xDEFB, 0xF800, 0x5800, 20, 30, 10, 20, 1 #END var Led1[WIDGET_RAM_SPACE]; func main() var hndl; hndl := widget_Create(10); widget_Add(hndl, 0, Led1); gfx_Led(0, Led1, fLed1Info); pause(2000); gfx_Cls(); widget_ClearAttributes(hndl, 0, WIDGET_F_INITIALISED); gfx_Led(0, Led1, fLed1Info); repeat // do something here forever endfunc</pre>																						

2.23.14 widget_Touched(hndl, index)

Syntax	widget_Touched(hndl, index)
Arguments	hndl, index
	hndl Handle of the widget control
	index Index of element in the widget control
	The arguments can be a variable, array element, expression or constant.
Returns	status
	status Returns index or -1
Description	This function requires that a widget control has been created with the widget_Create() function. Returns index of the widget touched or returns -1 if no widget was touched. If index is passed as -1 or ALL the function tests all widgets.
Example	<pre>if(state == TOUCH_PRESSED) n := widget_Touched(hndl, ALL); //scan widget list, looking for a touch if(n != -1) print(n); // print index of widget touched endif endif</pre>

2.23.15 widget_FontID(id)

Syntax	widget_FontID(id)	
Arguments	id	
	id	Text font ID for flash-based font
	The arguments can be a variable, array element, expression or constant.	
Returns	value	
	value	Returns id of previous font
Description	Set the required font.	
Example	<code>widget_FontID(0);</code>	

2.24. CRC Functions

Summary of Functions in this section:

- `crc_CSUM_8(buf, count)`

The CRC functions are mainly designed for serial communications, but are implemented in such a way that they can be used to other things as well.

2.24.1 crc_CSUM_8(buf, count)

Syntax	<code>crc_CSUM_8(buf, count);</code>	
Arguments	buf, count	
	buf	Source memory buffer. This is a string pointer.
	count	Number of bytes to be used to generate the CRC.
Returns	CRC	
	CRC	Returns the generated 8 bit checksum CRC.
Description	<p>Calculates the Checksum CRC as an 8 bit number. This is equivalent to simple addition of all bytes and returning the negated sum an 8 bit value. For the standard test string "123456789", crc_CSUM_8 will return 0x0023. Note if you calculate all of the incoming data INCLUDING the CRC, the result should be 0x00</p>	
Example	<code>Crc := crc_CSUM_8(str_Ptr(buf), 10);</code>	

3. System Registers Memory Map

The following tables outline in detail the PIXXI-28 and PIXXI-44 word-sized system registers and flags.

LABEL	ADDRESS		USAGE
	DEC	HEX	
RANDOM_LO	32	0x20	random generator LO word
RANDOM_HI	33	0x21	random generator HI word
SYSTEM_TIMER_LO	34	0x22	1msec system timer LO word
SYSTEM_TIMER_HI	35	0x23	1msec system timer HI word
TIMER0	36	0x24	1msec user timer 0
TIMER1	37	0x25	1msec user timer 1
TIMER2	38	0x26	1msec user timer 2
TIMER3	39	0x27	1msec user timer 3
TIMER4	40	0x28	1msec user timer 3
TIMER5	41	0x29	1msec user timer 3
TIMER6	42	0x2A	1msec user timer 3
TIMER7	43	0x2B	1msec user timer 3
SYS_X_MAX	44	0x2C	display hardware X res-1
SYS_Y_MAX	45	0x2D	display hardware Y res-1
GFX_XMAX	46	0x2E	width of current orientation
GFX_YMAX	47	0x2F	height of current orientation
GFX_LEFT	48	0x30	image left real point
GFX_TOP	49	0x31	image top real point
GFX_RIGHT	50	0x32	image right real point
GFX_BOTTOM	51	0x33	image bottom real point
GFX_X1	52	0x34	image left clipped point
GFX_Y1	53	0x35	image top clipped point
GFX_X2	54	0x36	image right clipped point
GFX_Y2	55	0x37	image bottom clipped point
GFX_X_ORG	56	0x38	current X origin
GFX_Y_ORG	57	0x39	current Y origin
GFX_HILITE_LINE	58	0x3A	current multi line button hilite line
GFX_LINE_COUNT	59	0x3B	count of lines in multiline button
GFX_LAST_SELECTION	60	0x3C	last selected line
GFX_HIGHLIGHT_BACKGROUND	61	0x3D	multi button hilite background colour
GFX_HIGHLIGHT_FOREGROUND	62	0x3E	multi button hilite foreground colour
GFX_BUTTON_FOREGROUND	63	0x3F	store default text colour for hilite line tracker
GFX_BUTTON_BACKGROUND	64	0x40	store default button colour for hilite line tracker
GFX_BUTTON_MODE	65	0x41	store current buttons mode
GFX_TOOLBAR_HEIGHT	66	0x42	height above
GFX_STATUSBAR_HEIGHT	67	0x43	height below
GFX_LEFT_GUTTER_WIDTH	68	0x44	width to left
GFX_RIGHT_GUTTER_WIDTH	69	0x45	width to right
GFX_PIXEL_SHIFT	70	0x46	pixel shift for button depress illusion
GFX_VECT_X1	71	0x47	gp rect, used by multiline button to hilite required line
GFX_VECT_Y1	72	0x48	
GFX_VECT_X2	73	0x49	
GFX_VECT_Y2	74	0x4A	
GFX_THUMB_PERCENT	75	0x4B	size of slider thumb as percentage
GFX_THUMB_BORDER_DARK	76	0x4C	darker shadow of thumb
GFX_THUMB_BORDER_LIGHT	77	0x4D	lighter shadow of thumb
TOUCH_XMINCAL	78	0x4E	touch calibration value

TOUCH_YMINCAL	79	0x4F	touch calibration value
TOUCH_XMAXCAL	80	0x50	touch calibration value
TOUCH_YMAXCAL	81	0x51	touch calibration value
IMG_WIDTH	82	0x52	width of currently loaded image
IMG_HEIGHT	83	0x53	height of currently loaded image
IMG_FRAME_DELAY	84	0x54	if image, else inter frame delay for movie
IMG_FLAGS	85	0x55	bit 4 determines colour mode, other bits reserved
IMG_FRAME_COUNT	86	0x56	count of frames in a movie
IMG_PIXEL_COUNT_LO	87	0x57	count of pixels in the current frame
IMG_PIXEL_COUNT_HI	88	0x58	count of pixels in the current frame
IMG_CURRENT_FRAME	89	0x59	last frame shown
MEDIA_ADDRESS_LO	90	0x5A	uSD byte address LO
MEDIA_ADDRESS_HI	91	0x5B	uSD byte address HI
MEDIA_SECTOR_LO	92	0x5C	uSD sector address LO
MEDIA_SECTOR_HI	93	0x5D	uSD sector address HI
MEDIA_SECTOR_COUNT	94	0x5E	uSD number of bytes remaining in sector
TEXT_XPOS	95	0x5F	text current x pixel position
TEXT_YPOS	96	0x60	text current y pixel position
TEXT_MARGIN	97	0x61	text left pixel pos for carriage return
TXT_FONT_TYPE	98	0x62	font type, 0 = system font, else pointer to user font
TXT_FONT_MAX	99	0x63	max number of chars in font
TXT_FONT_OFFSET	100	0x64	starting offset (normally 0x20)
TXT_FONT_WIDTH	101	0x65	current font width
TXT_FONT_HEIGHT	102	0x66	current font height
GFX_TOUCH_REGION_X1	103	0x67	touch capture region
GFX_TOUCH_REGION_Y	104	0x68	touch capture region
GFX_TOUCH_REGION_X2	105	0x69	touch capture region
GFX_TOUCH_REGION_Y2	106	0x6A	touch capture region
GFX_CLIP_LEFT_VAL	107	0x6B	left clipping point (set with gfx_ClipWindow(...))
GFX_CLIP_TOP_VAL	108	0x6C	top clipping point (set with gfx_ClipWindow(...))
GFX_CLIP_RIGHT_VAL	109	0x6D	right clipping point (set with gfx_ClipWindow(...))
GFX_CLIP_BOTTOM_VAL	110	0x6E	bottom clipping point (set with gfx_ClipWindow(...))
GFX_CLIP_LEFT	111	0x6F	current clip value (reads full size if clipping turned off)
GFX_CLIP_TOP	112	0x70	current clip value (reads full size if clipping turned off)
GFX_CLIP_RIGHT	113	0x71	current clip value (reads full size if clipping turned off)
GFX_CLIP_BOTTOM	114	0x72	current clip value (reads full size if clipping turned off)
GRAM_PIXEL_COUNT_LO	115	0x73	LO word of count of pixels in the set GRAM area
GRAM_PIXEL_COUNT_HI	116	0x74	HI word of count of pixels in the set GRAM area
TOUCH_RAW_X	117	0x75	12-bit raw A2D X value from touch screen
TOUCH_RAW_Y	118	0x76	12-bit raw A2D Y value from touch screen
GFX_LAST_CHAR_WIDTH	119	0x77	calculated char width from last call to charWidth function
GFX_LAST_CHAR_HEIGHT	120	0x78	calculated height from last call to charHeight function
GFX_LAST_STR_WIDTH	121	0x79	calculated width from last call to strWidth function
GFX_LAST_STR_HEIGHT	122	0x7A	calculated height from last call to strHeight function

Note: These registers are accessible with peekW and pokeW functions.

4. Appendix A: Runtime Error Messages

Error No.	Meaning	Category
1	Failed to receive 'L' during loading process from the IDE	IDE
2	Did not receive valid header info from the IDE	IDE
3	Header size does not match loader info	IDE
4	Could not allocate enough memory for program	IDE
5	Loader checksum error	IDE
6	Did not receive header prior to 'L' command	IDE
7	Header size entry does not match loader value	IDE
8	Failed to load program from FLASH	Internal
9	Could not allocate code segment	File loader
10	Could not load function file from disk	File loader
11	Bad header in program file	File loader
12	Header in program file differs from file size	File loader
13	Could not allocate global memory for program file	File loader
14	Program File checksum error	File loader
15	EVE Stack Overflow	System

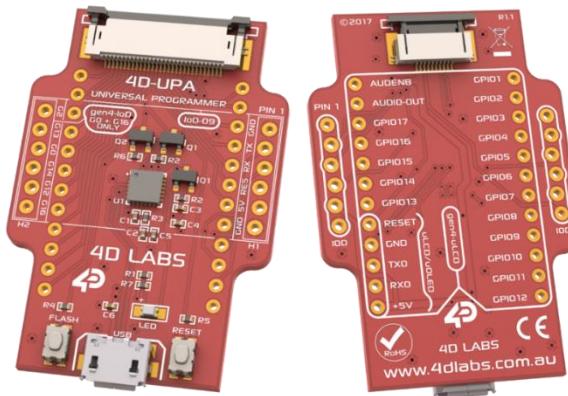

Error No.	Meaning	V1	V2
16	Unsupported PmmC function	fnc	1 st Arg
17	Illegal COM0 Event Function address	addr	(ignored)
18	Illegal COM1 Event Function address	addr	(ignored)
19	Bad txt_Set(...) command number	command	value
20	Bad gfx_Get(...) command number	command	(ignored)
21	Bad txt_Set(...) command number	command	value
22	Bad address for peekW or pokeW	command	(ignored)
23	Bad timer number for sys_SetTimer(..) or sys_GetTimer(..)	tnum	value
24	Bad timer number for sys_SetTimerFunction(...)	tnum	funcaddr
25	Total size exceeds Flash Size	(ignored)	(ignored)

5. Hardware Tools

The following hardware tools are required for full control of the PIXXI processor.

5.1. Programming Tools

The 4D-UPA Programming Adaptor (image shown below) is an essential hardware tools to program, customise, and test the PIXXI Processor.

The 4D-UPA Programming Adaptor is used to program a new Firmware/PmmC, Display Driver and for downloading compiled 4DGL code into the processor. It can even serve as an interface for communicating serial data to the PC.

The 4D-UPA Programming Adaptor is available from 4D Systems, www.4dsystems.com.au

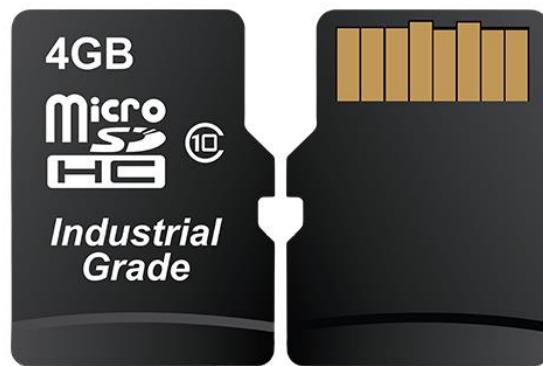

Note: Using a non-4D programming interface could damage your processor and void your Warranty.

Note: Most 4D Systems programmers can be used to program the PIXXI Processors, along with previous generation 4D programmers too. The 4D-UPA is the latest programmer being produced.

6. Memory Cards

The PIXXI processor uses off the shelf standard SDHC/SD/micro-SD memory cards with up to 2GB capacity usable with FAT16 formatting. For any FAT file related operations, before the memory card can be used it must first be formatted with FAT16 option. The formatting of the card can be done on any PC system with a card reader. Select the appropriate drive and choose the FAT16 (or just FAT in some systems) option when formatting. The card is now ready to be used in the PIXXI based application.

The PIXXI processor also supports high capacity HC memory cards (4GB and above). The available capacity of SD-HC cards varies according to the way the card is partitioned and the commands used to access it. Below is an image of a 4GB micro-SD memory card.

The FAT partition is always first (if it exists) and can be up to the maximum size permitted by FAT16. Windows 7 will format FAT16 up to 4GB. Windows XP will format FAT16 up to 2GB and the Windows XP command prompt will format FAT16 up to 4GB.

RMPET, a 4D Labs Tool found in the Panda Studio IDE, is capable of repartitioning and formatting microSD cards to be the appropriate type and format for 4D Labs processors. This should be used for all cards.

Note: A SPI Compatible SDHC/SD/micro-SD card MUST be used. PIXXI along with other 4D Labs Processors requires SPI mode to communicate with the SD card. If a non-SPI compatible SD card is used then the processor will simply not be able to mount the card.

Note: Read disturb is a well-known issue with flash memory devices, such as micro-SD cards, where reading data from a flash cell can cause the nearby cells in the same memory block to change over time.

This can be prevented by using industrial-grade micro-SD cards with read disturb protection. Industrial-grade micro-SD cards have a firmware that actively monitors the read operation and refreshes areas of memory which have high traffic and even move data around to prevent read disturb error from occurring. Furthermore, manufacturers may choose to implement read disturb protection on a certain part of the flash memory only, such that the beginning part of the memory might not be protected. The RMPET utility in Panda Studio is designed to create the first partition at an offset from the start of the micro-SD card to account for this situation. It is therefore recommended to always partition and format an industrial micro-SD card using the RMPET utility prior to using it with 4D Labs processors.

7. Workshop4 IDE

Workshop4 is a comprehensive software IDE that provides an integrated software development platform for all of the 4D family of processors and modules. The IDE combines the Editor, Compiler, Linker and Downloader to develop complete 4DGL application code. All user application code is developed within the Workshop4 IDE.

The Workshop4 IDE supports multiple development environments for the user, to cater for different user requirements and skill level. The list below provides a short description for each of the available environments in Workshop4. The following subsections discuss these environments in detail.

- The Designer environment enables the user to write 4DGL code in its natural form.
- A visual programming experience, suitably called ViSi, enables drag-and-drop type placement of objects to assist with 4DGL code generation and allows the user to visualise how the display will look while being developed.
- An advanced environment called ViSi-Genie doesn't require any 4DGL coding at all, it is all done automatically for you. Simply lay the display out with the objects you want, set the events to drive them and the code is written for you automatically. ViSi-Genie provides the latest rapid development experience from 4D Labs.

The Workshop4 IDE is available from the 4D Systems website. www.4dsystems.com.au

For a comprehensive manual on the Workshop4 IDE Software along with other documents, refer to the documentation from the 4D Labs website, on the Workshop4 product page.

8. Revision History

Revision	Revision Content	Revision Date
1.0	Initial Internal Release Version	-
1.1	Initial Release Version	18/06/2020
1.2	Added crc_CSUM_8, gfx_GradientShape, gfx_GradientColor and gfx_GradTriangleFilled functions Updated spi_Init so its application is clear	16/07/2020
1.3	Addition of flash_functions	04/08/2020
1.4	media_Init4() function added for 32MB SPI Flash memory support, and media_Init() updated	07/10/2020
1.5	Added note to img_File* functions regarding GCF and Flash only. Fixed incorrect information on mem_Realloc function return, and ptr syntax.	08/12/2020
1.6	Added baud rate formula for calculating actual baud rate and error %. See setbaud() and com_SetBaud() functions. Corrected setbaud() table, which had actual baud and error values which were incorrect.	21/12/2020
1.7	Updated the 'value' description for gfx_LedDigits	14/07/2021
1.8	Updated notes on multiple functions to distinguish which ones are Flash or uSD PmmC only functions. Added intflash_section and functions	02/09/2022
1.9	Added bus_In() and bus_Out(value) functions	06/10/2022

9. Legal Notice

9.1. Proprietary Information

The information contained in this document is the property of 4D Labs Semiconductors and may be the subject of patents pending or granted, and must not be copied or disclosed without prior written permission.

4D Labs Semiconductors endeavours to ensure that the information in this document is correct and fairly stated but does not accept liability for any error or omission. The development of 4D Labs Semiconductors products and services is continuous and published information may not be up to date. It is important to check the current position with 4D Labs Semiconductors. 4D Labs Semiconductors reserves the right to modify, update or make changes to Specifications or written material without prior notice at any time.

All trademarks belong to their respective owners and are recognised and acknowledged.

9.2. Disclaimer of Warranties & Limitation of Liability

4D Labs Semiconductors makes no warranty, either expressed or implied with respect to any product, and specifically disclaims all other warranties, including, without limitation, warranties for merchantability, non-infringement and fitness for any particular purpose.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.

Images and graphics used throughout this document are for illustrative purposes only. All images and graphics used are possible to be displayed on the 4D Labs Semiconductors range of products, however the quality may vary.

In no event shall 4D Labs Semiconductors be liable to the buyer or to any third party for any indirect, incidental, special, consequential, punitive or exemplary damages (including without limitation lost profits, lost savings, or loss of business opportunity) arising out of or relating to any product or service provided or to be provided by 4D Labs Semiconductors, or the use or inability to use the same, even if 4D Labs Semiconductors has been advised of the possibility of such damages.

4D Labs Semiconductors products are not fault tolerant nor designed, manufactured or intended for use or resale as on line control equipment in hazardous environments requiring fail – safe performance, such as in the operation of nuclear facilities, aircraft navigation or communication systems, air traffic control, direct life support machines or weapons systems in which the failure of the product could lead directly to death, personal injury or severe physical or environmental damage ('High Risk Activities'). 4D Labs Semiconductors and its suppliers specifically disclaim any expressed or implied warranty of fitness for High Risk Activities.

Use of 4D Labs Semiconductors' products and devices in 'High Risk Activities' and in any other application is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless 4D Labs Semiconductors from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any 4D Labs Semiconductors intellectual property rights.
